1 Foreword

1.1 Notes on the documentation

This description is only intended for the use of trained specialists in control and automation engineering who are familiar with the applicable national standards.

It is essential that the documentation and the following notes and explanations are followed when installing and commissioning the components.

It is the duty of the technical personnel to use the documentation published at the respective time of each installation and commissioning.

The responsible staff must ensure that the application or use of the products described satisfy all the requirements for safety, including all the relevant laws, regulations, guidelines and standards.

Disclaimer

The documentation has been prepared with care. The products described are, however, constantly under development.

We reserve the right to revise and change the documentation at any time and without prior announcement. No claims for the modification of products that have already been supplied may be made on the basis of the data, diagrams and descriptions in this documentation.

Trademarks

Beckhoff®, TwinCAT®, EtherCAT®, Safety over EtherCAT®, TwinSAFE®, XFC® and XTS® are registered trademarks of and licensed by Beckhoff Automation GmbH.

Other designations used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owners.

Patent Pending

The EtherCAT Technology is covered, including but not limited to the following patent applications and patents:

EP1590927, EP1789857, DE102004044764, DE102007017835

with corresponding applications or registrations in various other countries.

The TwinCAT Technology is covered, including but not limited to the following patent applications and patents:

EP0851348, US6167425 with corresponding applications or registrations in various other countries.

EtherCAT

The reproduction, distribution and utilization of this document as well as the communication of its contents to others without express authorization are prohibited.

Offenders will be held liable for the payment of damages. All rights reserved in the event of the grant of a patent, utility model or design.

1.2 Safety instructions

Safety regulations

Please note the following safety instructions and explanations!
Product-specific safety instructions can be found on following pages or in the areas mounting, wiring, commissioning etc.

Exclusion of liability

All the components are supplied in particular hardware and software configurations appropriate for the application. Modifications to hardware or software configurations other than those described in the documentation are not permitted, and nullify the liability of Beckhoff Automation GmbH & Co. KG.

Personnel qualification

This description is only intended for trained specialists in control, automation and drive engineering who are familiar with the applicable national standards.

Description of symbols

In this documentation the following symbols are used with an accompanying safety instruction or note. The safety instructions must be read carefully and followed without fail!

 DANGER	<p>Serious risk of injury! Failure to follow the safety instructions associated with this symbol directly endangers the life and health of persons.</p>
 WARNING	<p>Risk of injury! Failure to follow the safety instructions associated with this symbol endangers the life and health of persons.</p>
 CAUTION	<p>Personal injuries! Failure to follow the safety instructions associated with this symbol can lead to injuries to persons.</p>
 Attention	<p>Damage to the environment or devices Failure to follow the instructions associated with this symbol can lead to damage to the environment or equipment.</p>
 Note	<p>Tip or pointer This symbol indicates information that contributes to better understanding.</p>

2 Overview

The TwinCAT TCP/IP Connection Server enables the implementation/realisation of one or more TCP/IP server/clients in the TwinCAT PLC. With its help, own TCP/IP based protocols (application layer) may be developed directly in a PLC program.

Product components

The product TF6310 TCP/IP consists of the following components, which will be delivered by the setup:

- **PLC library:** Tc2_Tcplp library (implements basic TCP/IP and UDP/IP functionalities).
- **Background program:** TwinCAT TCP/IP Connection Server (process which is used for communication).

2.1 Comparison TF6310 TF6311

The products TF6310 "TCP/IP" and TF6311 "TCP/UDP Realtime" offer similar functionality.

This page provides an overview of similarities and differences of the products:

	TF 6310	TF 6311
TwinCAT	TwinCAT 2 / 3	TwinCAT 3
Client/Server	Both	Both
Large / unknown networks	++	+
Determinism	+	++
High-volume data transfer	++	+
Programming languages	PLC	PLC and C++
Operating system	Win32/64, CE5/6/7	Win32/64, CE7
UDP-Multicast	Yes	No
Trial license	Yes	Yes
Protocols	TCP, UDP	TCP, UDP, Arp/Ping
Hardware requirements	Variable	TwinCAT-compatible network card
Socket configuration	See operating system (WinSock)	TCP/UDP RT TcCom Parameters

The Windows firewall cannot be used, since the TF6311 is directly integrated in the TwinCAT system. In larger / unknown networks we recommend using the TF6310.

3 Technical introduction

This section will give a general overview about the transport protocols TCP and UDP and will also link to the corresponding PLC libraries needed to implement each protocol. Both transport protocols are part of the Internet Protocol suite and therefore an important part of our everyday communication, e.g. the Internet.

Transmission Control Protocol (TCP)

TCP is a connection-oriented transport protocol (OSI layer 4) that can be compared to a telephone connection, where participants have to establish the connection first before data can be transmitted. TCP provides a reliable and ordered delivery of a stream of bytes, therefore it is considered to be a “stream-oriented transport protocol”. The TCP protocol is used for network applications where a receive confirmation is required for the data sent by a client or server. The TCP protocol is well suited for sending larger data quantities and transports a data stream without a defined start and end. For the transmitter this is not a problem since he knows how many data bytes are transmitted. However, the receiver is unable to detect where a message ends within the data stream and where the next data stream starts. A read call on the receiver side only supplies the data currently in the receive buffer (this may be less or more than the data block sent by the other device). Therefore the transmitter has to specify a message structure that is known to the receiver and can be interpreted. In simple cases the message structure may consist of the data and a final control character (e.g. carriage return). The final control character indicates the end of a message. A possible message structure which is indeed often used for transferring binary data with a variable length could be defined as follows: The first data bytes contain a special control character (a so-called start delimiter) and the data length of the subsequent data. This enables the receiver to detect the start and end of the message.

TCP/IP client

A minimum TCP/IP client implementation within the PLC requires the following function blocks:

- An instance of the [FB_SocketConnect \[▶ 21\]](#) and [FB_SocketClose \[▶ 22\]](#) function blocks for establishing and closing the connection to the remote server (Hint: [FB_ClientServerConnection \[▶ 36\]](#) encapsulates the functionality of both function blocks)
- An instance of the [FB_SocketSend \[▶ 26\]](#) and/or [FB_SocketReceive \[▶ 27\]](#) function block for the data exchange with the remote server

TCP/IP server

A minimum TCP/IP server implementation within the PLC requires the following function blocks:

- An instance of the [FB_SocketListen \[▶ 24\]](#) function block for opening the listener socket.
- An instance of the [FB_SocketAccept \[▶ 25\]](#) and [FB_SocketClose \[▶ 22\]](#) function blocks for establishing and closing the connection(s) to the remote clients (Hint: [FB_ServerClientConnection \[▶ 37\]](#) encapsulates the functionality of all three function block)
- An instance of the [FB_SocketSend \[▶ 26\]](#) and/or [FB_SocketReceive \[▶ 27\]](#) function block for the data exchange with the remote clients
- An instance of the [FB_SocketCloseAll \[▶ 23\]](#) function block is required in each PLC runtime system, in which a socket is opened.

The instances of the [FB_SocketAccept \[▶ 25\]](#) and [FB_SocketReceive \[▶ 27\]](#) function blocks are called cyclically (polling), all others are called as required.

User Datagram Protocol (UDP)

UDP is a connection-less protocol, which means that data is sent between network devices without an explicit connection. UDP uses a simple transmission model without implicitly defining workflows for handshaking, reliability, data ordering or congestion control. However, even as this implies that UDP datagrams may arrive out of order, appear duplicated, or congest the wire, UDP is in some cases preferred to TCP, especially in realtime communication because all mentioned features (which are implemented in TCP) require processing power and therefore time. Because of its connection-less nature, the UDP protocol is well suited for sending small data quantities. UDP is a “packet-oriented/message-oriented transport protocol”, i.e. the sent data block is received on the receiver side as a complete data block.

The following function blocks are required for a minimum UDP client/server implementation:

- An instance of the [FB_SocketUdpCreate \[▶ 29\]](#) and [FB_SocketClose \[▶ 22\]](#) function blocks for opening and closing an UDP socket (Hint: [FB_ConnectionlessSocket \[▶ 41\]](#) encapsulates the functionality of both function)
- An instance of the [FB_SocketUdpSendTo \[▶ 30\]](#) and/or [FB_SocketUdpReceiveFrom \[▶ 32\]](#) function blocks for the data exchange with other devices;
- An instance of the [FB_SocketCloseAll \[▶ 23\]](#) function block in each PLC runtime system, in which a UDP socket is opened

The instances of the [FB_SocketUdpReceiveFrom \[▶ 32\]](#) function block are called cyclically (polling), all others are called as required.

See also: [Samples \[▶ 52\]](#)

4 Installation

4.1 System requirements

The following article describes the minimum requirements needed for engineering and/or runtime systems.

Operating systems:

Windows XP Pro SP3

Windows 7 Pro (32-bit and 64-bit)

Windows XP Embedded

Windows Embedded Standard 2009

Windows Embedded 7

Windows CE6

Windows CE7

TwinCAT:

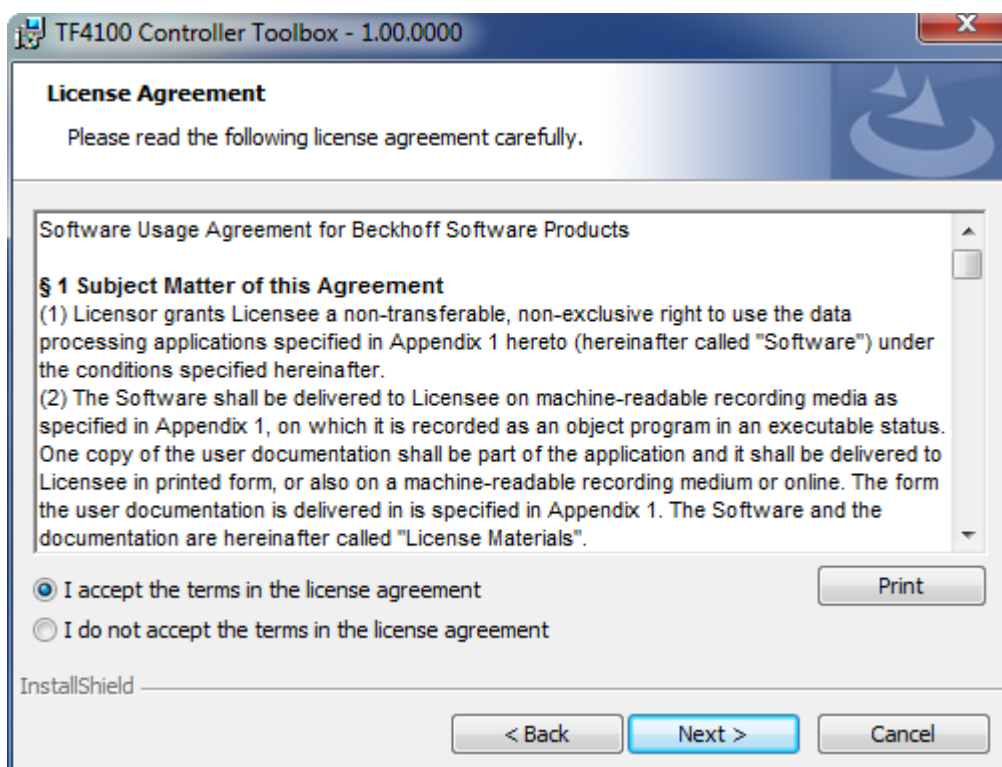

TwinCAT 3 XAR Build 3098 (or higher)

TwinCAT 3 XAE Build 3098 (or higher)

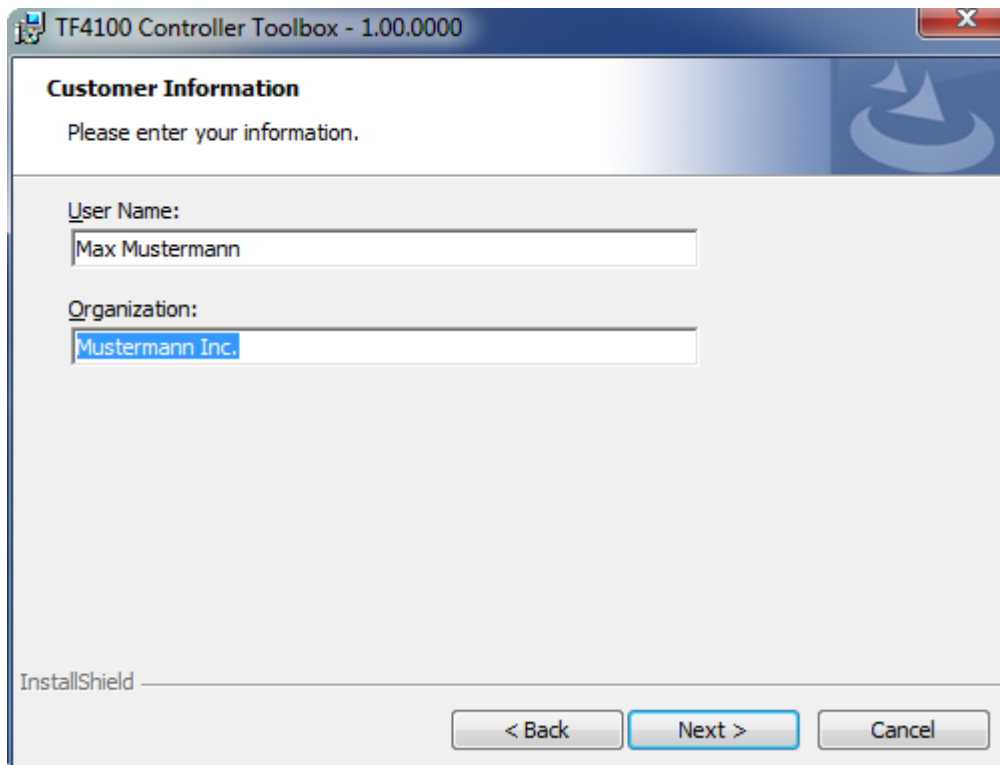

4.2 Installation

Description of the installation procedure of a TwinCAT 3 Function for Windows-based operating Systems.

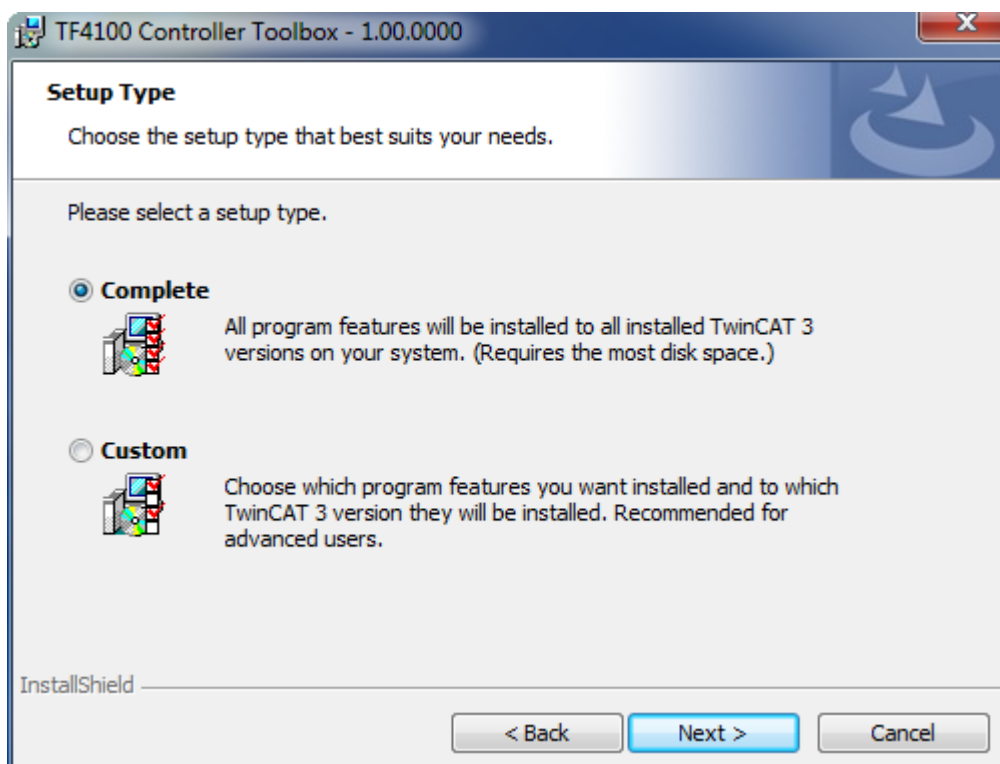

1. Double-click the downloaded setup file *TFxxxx*.
Please note: Under Windows 32-bit/64-bit, please start the installation with "Run as Administrator" by right-clicking the setup file and selecting the corresponding option in the context menu.
2. Click **Next** and accept the license agreement.

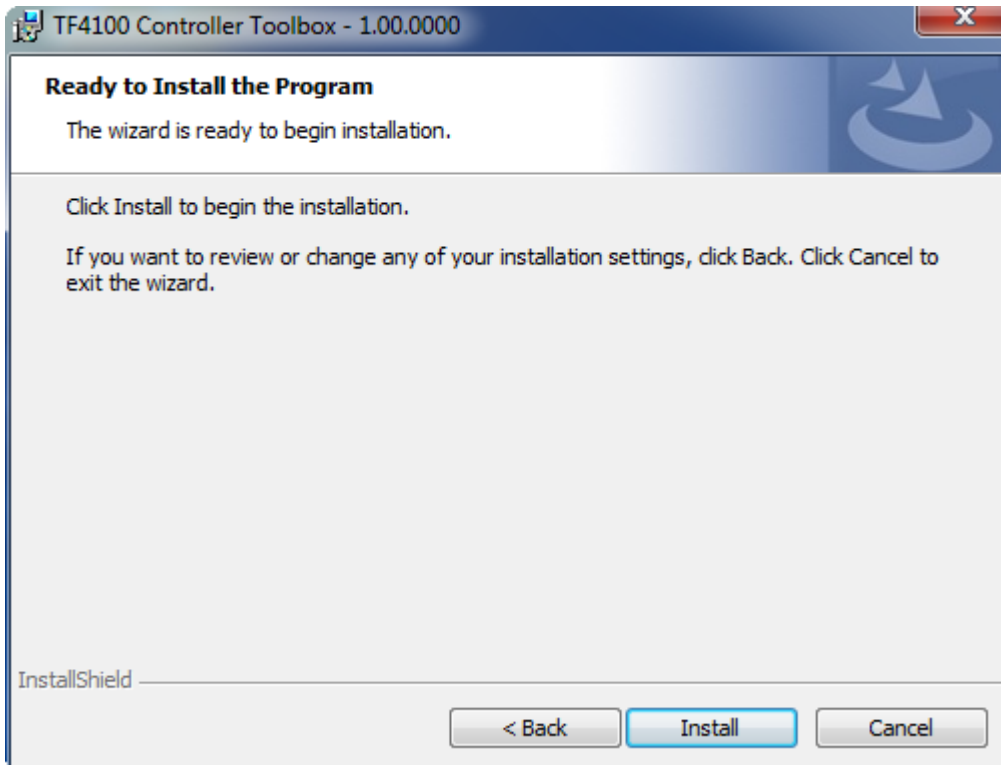

3. Enter your user information in the specified area.

4. To install the full product, including all sub-components, please choose **Complete** as the Setup Type. Alternatively, you can also install each component separately by choosing **Custom**.

- 5. Click **Next** and **Install** to start the installation.

The TwinCAT system must be stopped before proceeding with installation.

- 6. Confirm the Dialog with **Yes**.

7. Select **Finish** to end the installation process.

⇒ The installation is now complete.

After a successful installation, the TC 3 Function needs to be [licensed](#). [[▶ 15](#)]

4.3 Installation Windows CE

This section describes, how you can install the TwinCAT 3 Function TF6310 TCP/IP on a Beckhoff Embedded PC Controller based on Windows CE.

The setup process consists of four steps:

- [Download of the setup file](#) [[▶ 13](#)]
- [Installation on a host computer](#) [[▶ 13](#)]
- [Transferring the executable to the Windows CE device](#) [[▶ 14](#)]
- [Software installation](#) [[▶ 14](#)]

The last paragraph of this section describes the [Software upgrade](#) [[▶ 14](#)].

Download of the setup file

The CAB installation files for Windows CE are part of the TF6310 TCP/IP setup. Therefore you only need to download one setup file from www.beckhoff.com which contains binaries for Windows XP, Windows 7 and Windows CE (x86 and ARM).

The installation procedure of the TF6310 TCP/IP setup is described in the regular installation article (see [Installation](#) [[▶ 10](#)]).

Installation on a host computer

After installation, the install folder contains three directories - each one for a different hardware platform:

- **CE-ARM:** ARM-based Embedded Controllers running Windows CE, e.g. CX8090, CX9020
- **CE-X86:** X86-based Embedded Controllers running Windows CE, e.g. CX50xx, CX20x0

- **Win32:** Embedded Controllers running Windows XP, Windows 7 or Windows Embedded Standard

The CE-ARM and CE-X86 folders contain the TF6310 CAB files for Windows CE corresponding to the hardware platform of your Windows CE device. This file needs to be transferred to the Windows CE device.

Transferring the executable to the Windows CE device

Transfer the corresponding executable to your Windows CE device. This can be done via one of the following ways:

- via a Shared Folder
- via the integrated FTP-Server
- via ActiveSync
- via a CF card

For more information, please consult the "Windows CE" section in the Beckhoff Information System.

Software installation

After the file has been transferred via one of the above methods, execute the file and acknowledge the following dialog with **Ok**. Restart your Windows CE device after the installation has finished.

After the restart has been completed, the executable files of TF6310 are started automatically in the background.

The software is installed in the following directory on the CE device:

\Hard Disk\TwinCAT\Functions\TF6310-TCP-IP

Upgrade instructions

If you have already a version of TF6310 installed on your Windows CE device, you need to perform the following things on the Windows CE device to upgrade to a newer version:

1. Open the CE Explorer by clicking on **Start > Run** and entering "explorer".
2. Navigate to *\Hard Disk\TwinCAT\Functions\TF6310-TCP-IP\Server*.
3. Rename *TcplpServer.exe* to *TcplpServer.old*.
4. Restart the Windows CE device.
5. Transfer the new CAB-File to the CE device.
6. Execute the CAB-File and install the new version.
7. Delete *TcplpServer.old*.
8. Restart the Windows CE device.

⇒ After the restart is complete, the new version is active.

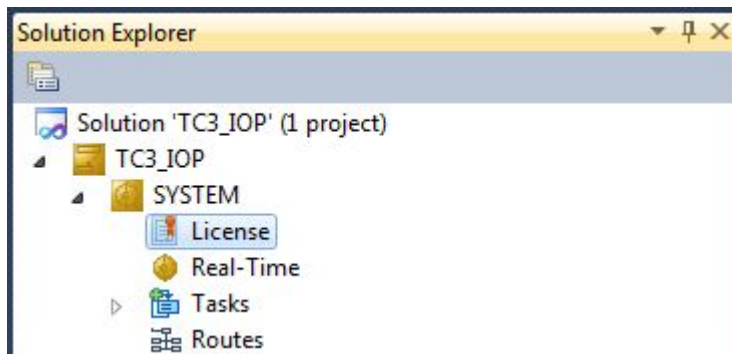

4.4 Licensing

The TwinCAT 3 functions are available both as a full and as a 7-Day trial version. Both license types can be activated via TwinCAT XAE. For more information about TwinCAT 3 licensing, please consult the TwinCAT 3 Help System. The following document describes both licensing scenarios for a TwinCAT 3 function on TwinCAT 3 and is divided into the following sections:

- [Licensing a 7-Day trial version \[▶ 15\]](#)
- [Licensing a full version \[▶ 16\]](#)

Licensing a 7-Day trial version

1. Start TwinCAT XAE
2. Open an existing TwinCAT 3 project or create a new project
3. In **Solution Explorer**, please navigate to the entry **System\License**

4. Open the tab **Manage Licenses** and add a **Runtime License** for your product (in this screenshot **TE1300: TC3 Scope View Professional**)

Order No	License	Add Runtime License
TC1000	TC3 ADS	<input checked="" type="checkbox"/> cpu license
TC1100	TC3 IO	<input type="checkbox"/> cpu license
TC1200	TC3 PLC	<input type="checkbox"/> cpu license
TC1210	TC3 PLC / C++	<input type="checkbox"/> cpu license
TC1220	TC3 PLC / C++ / MatSim	<input type="checkbox"/> cpu license
TC1250	TC3 PLC / NC PTP 10	<input type="checkbox"/> cpu license
TC1260	TC3 PLC / NC PTP 10 / NC I	<input type="checkbox"/> cpu license
TC1270	TC3 PLC / NC PTP 10 / NC I / CNC	<input type="checkbox"/> cpu license
TC1300	TC3 C++	<input type="checkbox"/> cpu license
TC1320	TC3 C++ / MatSim	<input type="checkbox"/> cpu license
TE1300	TC3 Scope View Professional	<input checked="" type="checkbox"/> cpu license
TE1400	TC3 Target For Matlab Simulink	<input type="checkbox"/> cpu license

5. **Optional:** If you would like to add a license for a remote device, you first need to connect to the remote device via TwinCAT XAE toolbar

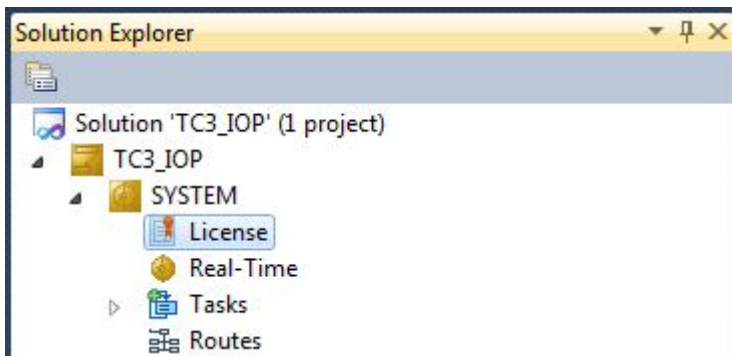

- Switch to the tab **Order Information** and click the button **Activate 7 Days Trial License...** to activate a test version

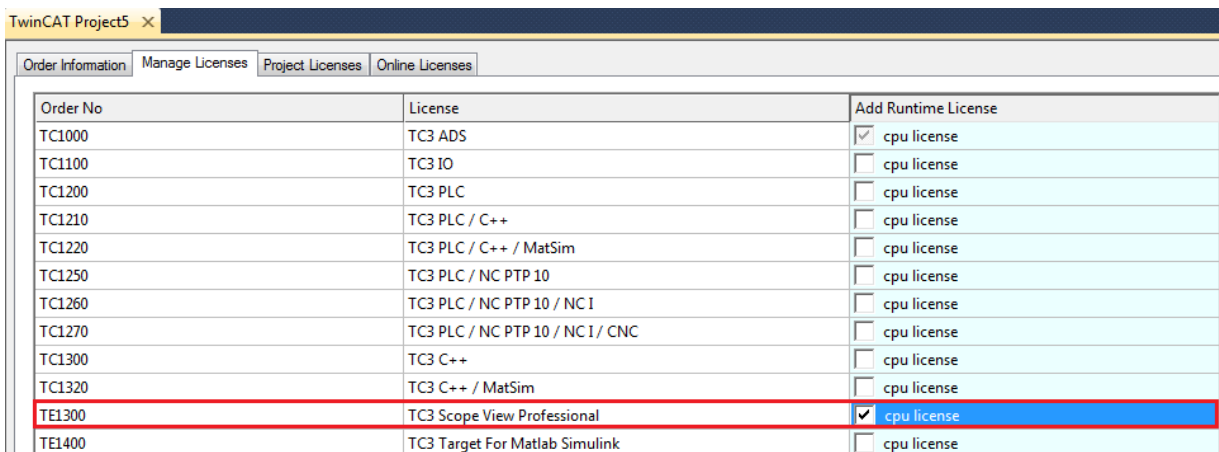

- Please restart TwinCAT 3 afterwards.

Licensing a full version

- Start TwinCAT XAE
- Open an existing TwinCAT 3 project or create a new project
- In **Solution Explorer**, please navigate to the entry **SYSTEMLicense**

- Open the tab **Manage Licenses** and add a **Runtime License** for your product (in this screenshot **TE1300: TC3 Scope View Professional**).

- Optional:** If you would like to add a license for a remote device, you first need to connect to the remote device via TwinCAT XAE toolbar

- Navigate to the **Order Information** tab
The fields **System-ID** and **HW Platform** cannot be changed and just describe the platform for the licensing process in general a TwinCAT 3 license is always bound to these two identifiers: the **System-ID** uniquely identifies your system.
The **HW Platform** is an indicator for the performance of the device.
- Optionally, you may also enter an own order number and description for your convenience

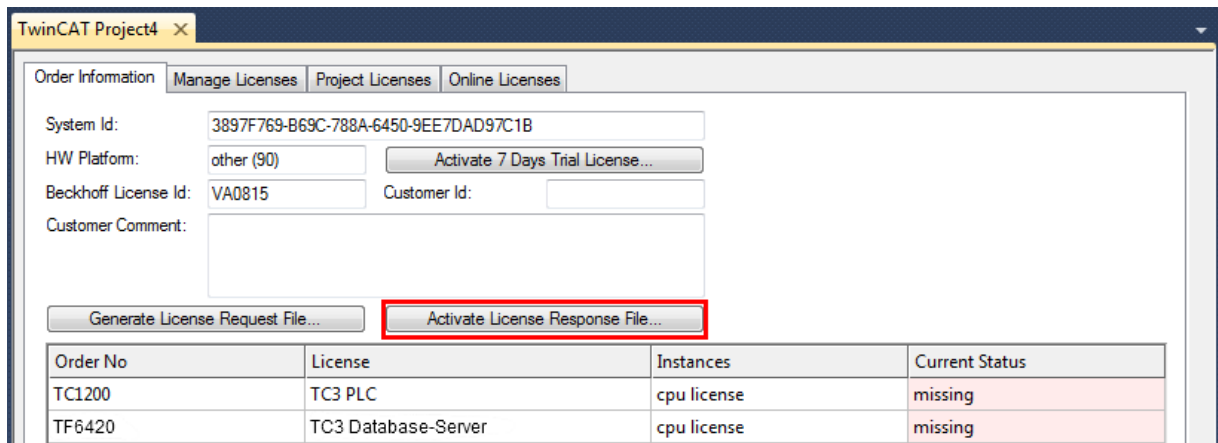

- enter the **Beckhoff License ID** and click on **Generate License Request File...** If you are not aware of your **Beckhoff License ID** please contact your local sales representative.
- After the license request file has been saved, the system asks whether to send this file via E-Mail to the Beckhoff Activation Server

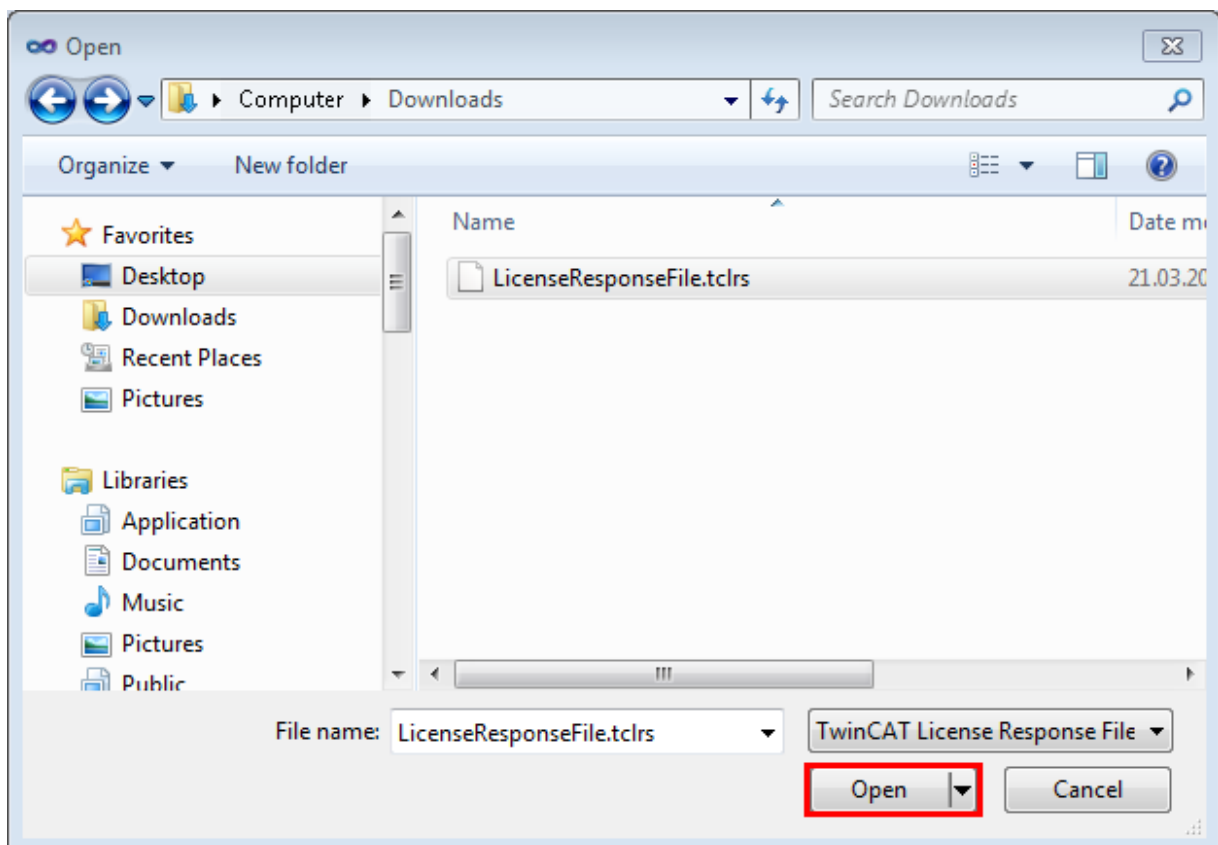

- After clicking **Yes**, the standard E-Mail client opens and creates a new E-Mail message to "tclicense@beckhoff.com" which contains the "License Request File"
- Send this Activation Request to Beckhoff
NOTE! The License Response File will be sent to the same E-Mail address used for sending out the License Request File

19. After receiving the activation file, please click on the button **Activate License Response File...** in the TwinCAT XAE license Interface.

20. Select the received License response file and click on **Open**

21. The License Response File will be imported and all included licenses will be activated. If there have been any trial licenses, these will be removed accordingly.

22. Please restart TwinCAT to activate licenses.

NOTE! The license file will be automatically copied to...\\TwinCAT\\3.1\\Target\\License on the local device.

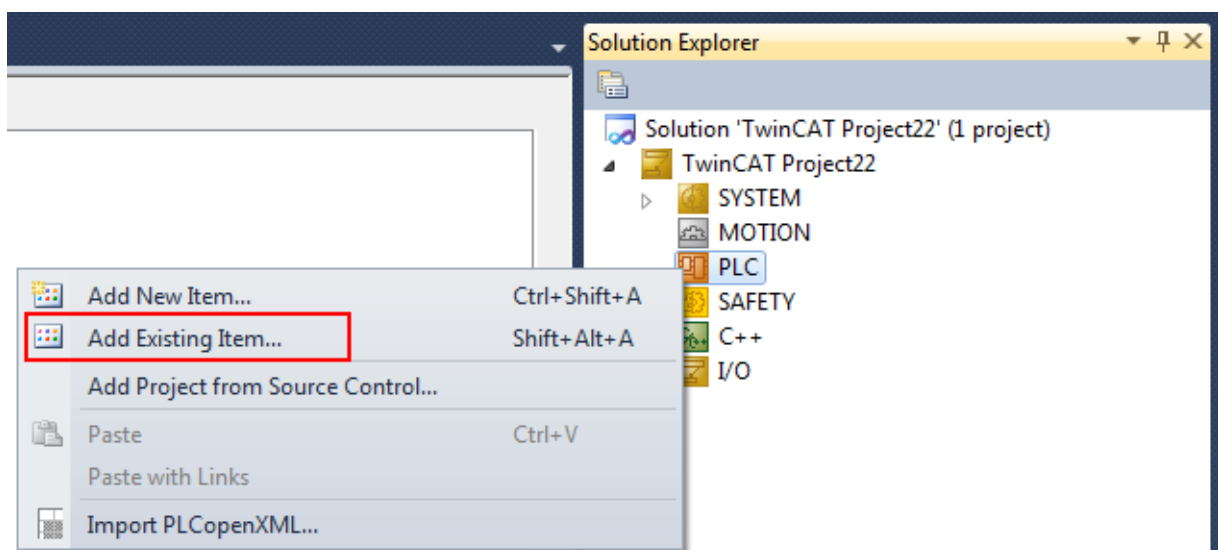

4.5 Migration from TwinCAT 2

If you would like to migrate an existing TwinCAT 2 PLC project which uses one of the TCP/IP Server's PLC libraries, you need to perform some manual steps to ensure that the TwinCAT 3 PLC converter can process the TwinCAT 2 project file (*.pro). In TwinCAT 2, the Function TCP/IP Server is delivered with three PLC libraries:

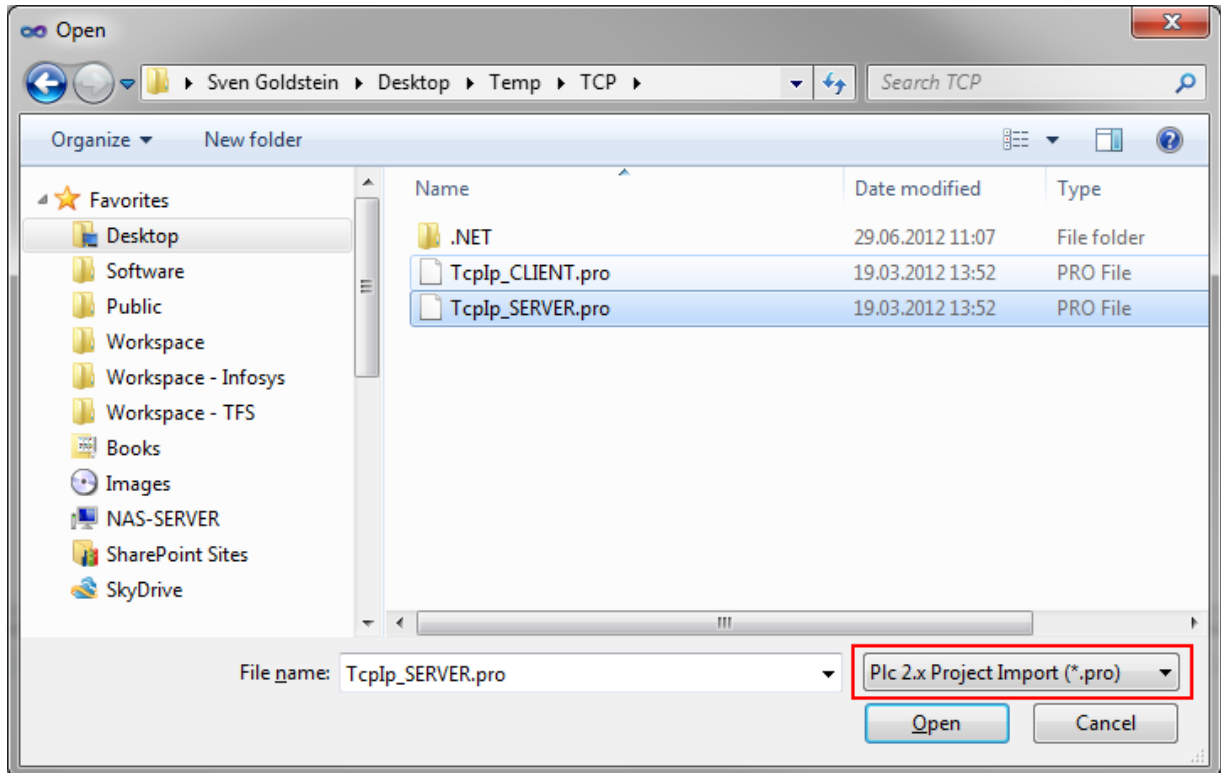

- Tcplp.lib
- TcSocketHelper.lib
- TcSnmp.lib

By default, these library files are installed in *C:\\TwinCAT\\Plc\\Lib*. Depending on the library used in your PLC project, you need to copy the corresponding library file to *C:\\TwinCAT3\\Components\\Plc\\Converter\\Lib* and then perform the following steps:

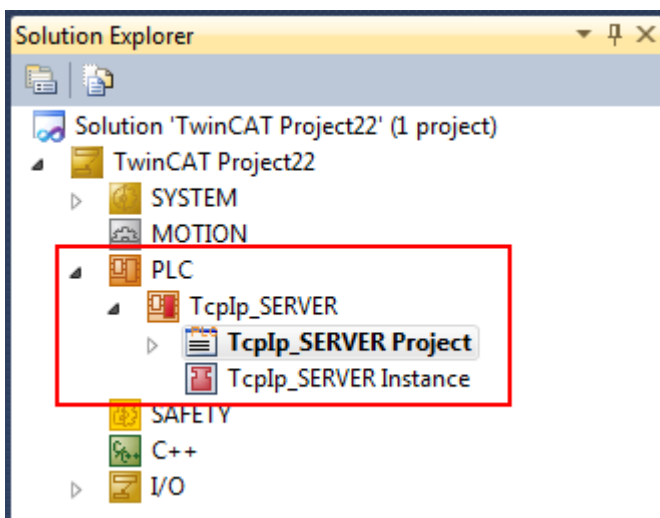

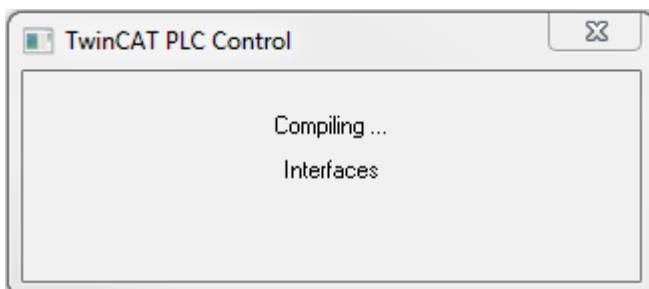

1. Open the TwinCAT Engineering.
2. Create a new TwinCAT 3 solution.
3. Right-click on the "PLC" node and select **Add Existing Item** in the context menu that opens.

- In the Open dialog, select the file type "Plc 2.x Project Import (*.pro)", browse to the folder containing your TwinCAT 2 PLC project and select the corresponding.pro file and click **Open**.

⇒ TwinCAT 3 starts the converter process and finally displays the converted PLC project under the "PLC" node.

5 PLC API

5.1 Function blocks

5.1.1 FB_SocketConnect

Using the function block FB_SocketConnect, a local client can establish a new TCP/IP connection to a remote server via the TwinCAT TCP/IP Connection Server. If successful, a new socket is opened, and the associated connection handle is returned at the hSocket output. The connection handle is required by the function blocks [FB_SocketSend \[► 26\]](#) and [FB_SocketReceive \[► 27\]](#), for example, in order to exchange data with a remote server. If a connection is no longer required, it can be closed with the function block [FB_SocketClose \[► 22\]](#). Several clients can establish a connection with the remote server at the same time. For each new client, a new socket is opened and a new connection handle is returned. The TwinCAT TCP/IP Connection Server automatically assigns a new IP port number for each client.

VAR_INPUT

```
VAR_INPUT
  sSrvNetId   : T_AmsNetId := '';
  sRemoteHost : T_IPv4Addr := '';
  nRemotePort : UDINT;
  bExecute    : BOOL;
  tTimeout    : TIME := T#45s; (*!!!*)
END_VAR
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

sRemoteHost: IP address (Ipv4) of the remote server as a string (e.g. '172.33.5.1'). An empty string can be entered on the local computer for a server.

nRemotePort: IP port number of the remote server (e.g. 200).

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

Note

Timeout value setup

The tTimeout value should not be set too low, since timeout periods of > 30s may occur in the event of a network interruption. If the value is too low, command execution would be interrupted prematurely, and ADS error code 1861 (timeout elapsed) would be returned instead of the Winsocket error WSAETIMEDOUT.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
  hSocket    : T_HSOCKET;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId : If the bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [► 88].

hSocket: TCP/IP [connection handle](#) [► 49] for the newly opened local client socket.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.2 FB_SocketClose

The function block FB_SocketClose can be used to close an open TCP/IP or UDP socket.

TCP/IP: The listener socket is opened with the function block [FB_SocketListen](#) [► 24], a local client socket with [FB_SocketConnect](#) [► 21] and a remote client socket with [FB_SocketAccept](#) [► 25].

UDP: The UDP socket is opened with the function block [FB_SocketUdpCreate](#) [► 29].

VAR_INPUT

```

VAR_INPUT
    sSrvNetId    : T_AmsNetId := '';
    hSocket      : T_HSOCKET;
    bExecute     : BOOL;
    tTimeout     : TIME := T#5s;
END_VAR

```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

hSocket:

- TCP/IP: [Connection handle](#) [► 49] of the listener, remote or local client socket to be closed.
- UDP: Connection handle of the UDP socket.

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

VAR_OUTPUT

```

VAR_OUTPUT
    bBusy       : BOOL;
    bError      : BOOL;
    nErrId      : UDINT;
END_VAR

```

bBusy: When the function block is activated this output is set. It remains set until and acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId: If the bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [► 88].

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.3 FB_SocketCloseAll

If TwinCAT is restarted or stopped, the TwinCAT TCP/IP Connection Server is also stopped. Any open sockets (TCP/IP and UDP connection handles) are closed automatically. The PLC program is reset after a "PLC reset", a "Rebuild all..." or a new "Download", and the information about already opened sockets (connection handles) is no longer available in the PLC. Any open connections can then no longer be closed properly.

The function block FB_SocketCloseAll can be used to close all connection handles (TCP/IP and UDP sockets) that were opened by a PLC runtime system. This means that, if FB_SocketCloseAll is called in one of the tasks of the first runtime systems (port 801), all sockets that were opened in the first runtime system are closed. In each PLC runtime system that uses the socket function blocks, an instance of FB_SocketCloseAll should be called during the PLC start (see below).

VAR_INPUT

```
VAR_INPUT
    sSrvNetId      : T_AmsNetId := '';
    bExecute       : BOOL;
    tTimeout       : TIME := T#5s;
END_VAR
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

VAR_OUTPUT

```
VAR_OUTPUT
    bBusy         : BOOL;
    bError        : BOOL;
    nErrId        : UDINT;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId : If the bError output is set, this parameter returns the TwinCAT TCP/IP Connection Server error number [► 88].

Example of an implementation in ST

The following program code is used to properly close the connection handles (sockets) that were open before a "PLC reset" or "Download" before a PLC restart.

```
PROGRAM MAIN
VAR
    fbSocketCloseAll : FB_SocketCloseAll;
    bCloseAll        : BOOL := TRUE;
END_VAR
```

```

IF bCloseAll THEN(*On PLC reset or program download close all old connections *)
    bCloseAll := FALSE;
    fbSocketCloseAll( sSrvNetId:= '', bExecute:= TRUE, tTimeout:= T#10s );
ELSE
    fbSocketCloseAll( bExecute:= FALSE );
END_IF
IF NOT fbSocketCloseAll.bBusy THEN
(*...
... continue program execution...
...*)
END_IF
    
```

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.4 FB_SocketListen

Using the function block **FB_SocketListen**, a new listener socket can be opened via the TwinCAT TCP/IP Connection Server. Via a listener socket, the TwinCAT TCP/IP Connection Server can 'listen' for incoming connection requests from remote clients. If successful, the associated connection handle is returned at the *hListener* output. This handle is required by the function block **FB_SocketAccept** [▶ 25]. If a listener socket is no longer required, it can be closed with the function block **FB_SocketClose** [▶ 22]. The listener sockets on an individual computer must have unique IP port numbers.

VAR_INPUT

```

VAR_INPUT
    sSrvNetId : T_AmsNetId := '';
    sLocalHost : T_IPv4Addr := '';
    nLocalPort : UDINT;
    bExecute : BOOL;
    tTimeout : TIME := T#5s;
END_VAR
    
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

sLocalHost: Local server IP address (Ipv4) as a string (e.g. '172.13.15.2'). For a server on the local computer (default), an empty string may be entered.

nLocalPort: Local server IP port (e.g. 200).

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

VAR_OUTPUT

```

VAR_OUTPUT
    bBusy : BOOL;
    bError : BOOL;
    nErrId : UDINT;
    hListener : T_HSOCKET;
END_VAR
    
```

bBusy: When the function block is activated this output is set. It remains set until and acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId: If the bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [[▶ 88](#)].

hListener: [Connection handle](#) [[▶ 49](#)] for the new listener socket.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.5 FB_SocketAccept

The remote client connection requests arriving at the TwinCAT TCP/IP Connection Server have to be acknowledged (accepted). The function block FB_SocketAccept accepts the incoming remote client connection requests, opens a new remote client socket and returns the associated connection handle. The connection handle is required by the function blocks [FB_SocketSend](#) [[▶ 26](#)] and [FB_SocketReceive](#) [[▶ 27](#)] in order to exchange data with the remote client, for example. All incoming connection requests first have to be accepted. If a connection is no longer required or undesirable, it can be closed with the function block [FB_SocketClose](#) [[▶ 22](#)].

A server implementation requires at least one instance of this function block. This instance has to be called cyclically (polling) from a PLC task. The block can be activated cyclically via a rising edge at the bExecute input (e.g. every 5 seconds).

If successful, the bAccepted output is set, and the connection handle to the new remote client is returned at the hSocket output. No error is returned if there are no new remote client connection requests. Several remote clients can establish a connection with the server at the same time. The connection handles of several remote clients can be retrieved sequentially via several function block calls. Each connection handle for a remote client can only be retrieved once. It is recommended to keep the connection handles in a list (array). New connections are added to the list, and closed connections must be removed from the list.

VAR_INPUT

```

VAR_INPUT
  sSrvNetId      : T_AmsNetId := '';
  hListener      : T_HSOCKET;
  bExecute       : BOOL;
  tTimeout       : TIME := T#5s;
END_VAR
    
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

hListener: [Connection handle](#) [[▶ 49](#)] of the listener sockets. This handle must first be requested via the function block [FB_SocketListen](#) [[▶ 24](#)].

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

VAR_OUTPUT

```
VAR_OUTPUT
  bAccepted : BOOL;
  bBusy     : BOOL;
  bError    : BOOL;
  nErrId    : UDINT;
  hSocket   : T_HSOCKET;
END_VAR
```

bAccepted: This output is set if a new connection to a remote client was established.

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId : If the bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [► 88].

hSocket: [Connection handle](#) [► 49] of a new remote client.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.6 FB_SocketSend

Using the function block FB_SocketSend, data can be sent to a remote client or remote server via the TwinCAT TCP/IP Connection Server. A remote client connection will first have to be established via the function block [FB_SocketAccept](#) [► 25], or a remote server connection via the function block [FB_SocketConnect](#) [► 21].

VAR_INPUT

```
VAR_INPUT
  sSrvNetId : T_AmsNetId := '';
  hSocket   : T_HSOCKET;
  cbLen     : UDINT;
  pSrc      : POINTER TO BYTE;
  bExecute  : BOOL;
  tTimeout  : TIME := T#5s;
END_VAR
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

hSocket: [Connection handle](#) [► 49] of the communication partner to which data are to be sent.

cbLen: Number (in bytes) of data to be sent.

pSrc: Address (pointer) of the send buffer.

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

 Note	<p>Timeout value setup</p> <p>If the send buffer of the socket is full, for example because the remote communication partner receives the transmitted data not quickly enough or large quantities of data are transmitted, the FB_SocketSend function block will return ADS timeout error 1861 after the tTimeout time. In this case, the value of the tTimeout input variable has to be increased accordingly.</p>
--	--

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId: If the bError output is set, this parameter returns the TwinCAT TCP/IP Connection Server error number [▶ 88].

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_TcpIp (communication)

5.1.7 FB_SocketReceive

Using the function block FB_SocketReceive, data from a remote client or remote server can be received via the TwinCAT TCP/IP Connection Server. A remote client connection will first have to be established via the function block FB_SocketAccept [▶ 25], and a remote server connection via the function block FB_SocketConnect [▶ 21]. The data can be received or sent in fragmented form (i.e. in several packets) within a TCP/IP network. It is therefore possible that not all data may be received with a single call of the FB_SocketReceive instance. For this reason, the instance has to be called cyclically (polling) within the PLC task, until all required data have been received. During this process, an rising edge is generated at the bExecute input, e.g. every 100 ms. If successful, the data received last are copied into the receive buffer. The nRecBytes output returns the number of the last successfully received data bytes. If no new data could be read during the last call, the function block returns no error and nRecBytes == zero.

In a simple protocol for receiving, for example, a zero-terminated string on a remote server, the function block FB_SocketReceive, for example, will have to be called repeatedly until the zero termination was detected in the data received.

Note

Timeout value setup

If the remote device was disconnected from the TCP/IP network (on the remote side only) while the local device is still connected to the TCP/IP network, the FB_SocketReceive function block returns no error and no data. The socket is still open, but no data are received. In this case, the application may possibly wait for remaining data bytes indefinitely. It is recommended to implement timeout monitoring in the PLC application. If not all data were received after a certain period, e.g. 10 seconds, the connection has to be closed and reinitialised.

VAR_INPUT

```
VAR_INPUT
  sSrvNetId : T_AmsNetId := '';
  hSocket   : T_HSOCKET;
  cbLen     : UDINT;
  pDest     : POINTER TO BYTE;
  bExecute  : BOOL;
  tTimeout  : TIME := T#5s;
END_VAR
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

hSocket: Connection handle [► 49] of the communication partner from which data are to be received.

cbLen: Maximum available buffer size in bytes for the data to be read.

pDest: Address (pointer) of the receive buffer.

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
  nRecBytes  : UDINT;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId: If the bError output is set, this parameter returns the TwinCAT TCP/IP Connection Server error number [► 88].

nRecBytes: Number of the last successfully received data bytes.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.8 FB_SocketUdpCreate

The function block `FB_SocketUdpCreate` can be used to open a client/server socket for the User Datagram Protocol (UDP). If successful, a new socket is opened, and the associated socket handle is returned at the `hSocket` output. The handle is required by the function blocks `FB_SocketUdpSendTo` [▶ 30] and `FB_SocketUdpReceiveFrom` [▶ 32] in order to exchange data with a remote server, for example. If a UDP socket is no longer required, it can be closed with the function block `FB_SocketClose` [▶ 22]. The port address `nLocalHost` is internally reserved by the TCP/IP Connection Server for the UDP protocol (a "bind" is carried out). Several network adapters may exist in a PC. The input parameter `sLocalHost` determines the network adapter to be used. If the `sLocalHost` input variable is ignored (empty string), the TCP/IP Connection Server uses the default network adapter. This is usually the first network adapter from the list of the network adapters in the system control.

 Note	<p>Automatically created network connections</p> <p>If an empty string was specified for <code>sLocalHost</code> when <code>FB_SocketUdpCreate</code> was called and the PC was disconnected from the network, the system will open a new socket under the software loopback IP address: '127.0.0.1'.</p>
 Note	<p>Automatically created network connections with multiple network dapters</p> <p>If two or more network adapters are installed in the PC and an empty string was specified as <code>sLocalHost</code>, and the default network adapter was then disconnected from the network, the new socket will be opened under the IP address of the second network adapter.</p>
 Note	<p>Network address assignment</p> <p>In order to prevent the sockets from being opened under a different IP address, you can specify the <code>sLocalHost</code> address explicitly or check the returned address in the handle variable (<code>hSocket</code>), close the socket and re-open it.</p>

VAR_INPUT

```
VAR_INPUT
  sSrvNetId : T_AmsNetId := '';
  sLocalHost : T_IPv4Addr := '';
  nLocalPort : UDINT;
  bExecute : BOOL;
  tTimeout : TIME := T#5s;
END_VAR
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

sLocalHost: Local IP address (Ipv4) of the UDP client/server socket as a string (e.g. '172.33.5.1'). An empty string may be specified for the default network adapter

nLocalPort: Local IP port number of the UDP client/server socket (e.g. 200).

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy : BOOL;
  bError : BOOL;
  nErrId : UDINT;
  hSocket : T_HSOCKET;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

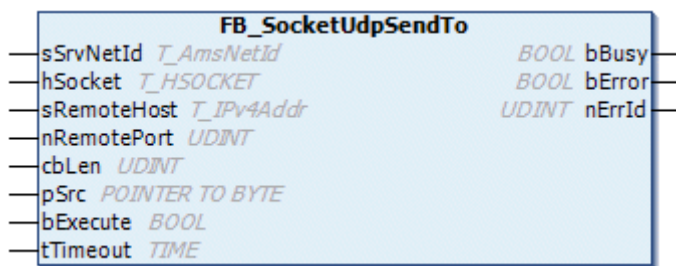

nErrId : If the bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [► 88].

hSocket: The [handle of the newly opened UDP client/server socket](#) [► 49].

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.9 FB_SocketUdpSendTo

The function block **FB_SocketUdpSendTo** can be used to send UDP data to a remote device via the TwinCAT TCP/IP Connection Server. The UDP socket must first be opened with the function block **FB_SocketUdpCreate** [► 29].

VAR_INPUT

```

VAR_INPUT
  sSrvNetId   : T_AmsNetId := '';
  hSocket     : T_HSOCKET;
  sRemoteHost : T_IPv4Addr;
  nRemotePort : UDINT;
  cbLen       : UDINT;
  pSrc        : POINTER TO BYTE;
  bExecute    : BOOL;
  tTimeout    : TIME := T#5s;
END_VAR

```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

hSocket: Handle of an open UDP socket [► 49].

sRemoteHost: IP address (IPv4) of the remote device to which data are to be sent as a string (e.g. '172.33.5.1'). An empty string can be entered on the local computer for a device

nRemotePort: IP port number of the remote device to which data are to be sent (e.g. 200).

cbLen: Number (in bytes) of data to be sent. The maximum number of data bytes to be sent is limited to 8192 bytes (constant declaration `TCPADS_MAXUDP_BUFFSIZE` in the library to save memory resources).

pSrc: Address (pointer) of the send buffer.

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

Note

Reception data bytes size setup

Available in the product version: TwinCAT TCP/IP Connection Server v1.0.50 or higher:
Possibility to increase the maximum number of data bytes to be received (only if absolute required).

TwinCAT 2

1) Redefine the global constant in your PLC project (in our example we want to increase the maximum number of data bytes to 32000 bytes):

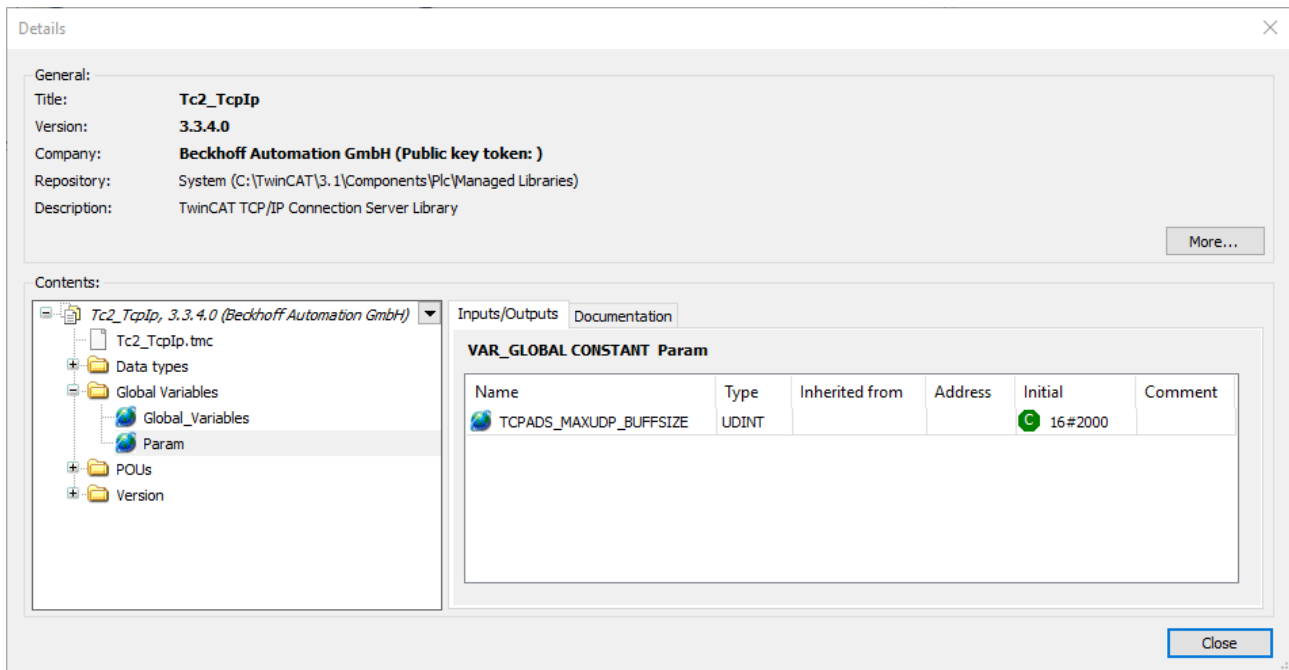

```
VAR_GLOBAL CONSTANT
    TCPADS_MAXUDP_BUFFSIZE : UDINT := 32000;
END_VAR
```

2) Activate the **Replace constants** option in the TwinCAT PLC Control dialog window (Project > Options ... > Build).

3) Rebuild your project.

TwinCAT 3

In TwinCAT 3, this value can be edited via a parameter list of the PLC library (from version 3.3.4.0).

VAR_OUTPUT

```
VAR_OUTPUT
    bBusy      : BOOL;
    bError     : BOOL;
    nErrId     : UDINT;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId: If the bError output is set, this parameter returns the TwinCAT TCP/IP Connection Server error number [► 88].

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.10 FB_SocketUdpReceiveFrom

Using the function block FB_SocketUdpReceiveFrom, data from an open UDP socket can be received via the TwinCAT TCP/IP Connection Server. The UDP socket must first be opened with the function block FB_SocketUdpCreate [▶ 29]. The instance of the FB_SocketUdpReceive function block has to be called cyclically (polling) within the PLC task. During this process, an rising edge is generated at the bExecute input, e.g. every 100ms. If successful, the data received last are copied into the receive buffer. The nRecBytes output returns the number of the last successfully received data bytes. If no new data could be read during the last call, the function block returns no error and nRecBytes == zero.

VAR_INPUT

```
VAR_INPUT
  sSrvNetId : T_AmsNetId := '';
  hSocket   : T_HSOCKET;
  cbLen     : UDINT;
  pDest     : POINTER TO BYTE;
  bExecute  : BOOL;
  tTimeout  : TIME := T#5s;
END_VAR
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

hSocket: Handle of an open UDP socket [▶ 49] whose data are to be received.

cbLen: Maximum available buffer size in bytes for the data to be read. The maximum number of data bytes to be received is limited to 8192 bytes (constant declaration TCPADS_MAXUDP_BUFFSIZE in the library to save memory resources).

pDest: Address (pointer) of the receive buffer.

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

Note

Reception data bytes size setup

Available in the product version: TwinCAT TCP/IP Connection Server v1.0.50 or higher: Possibility to increase the maximum number of data bytes to be received (only if absolute required).

TwinCAT 2

1) Redefine the global constant in your PLC project (in our example we want to increase the maximum number of data bytes to 32000 bytes):

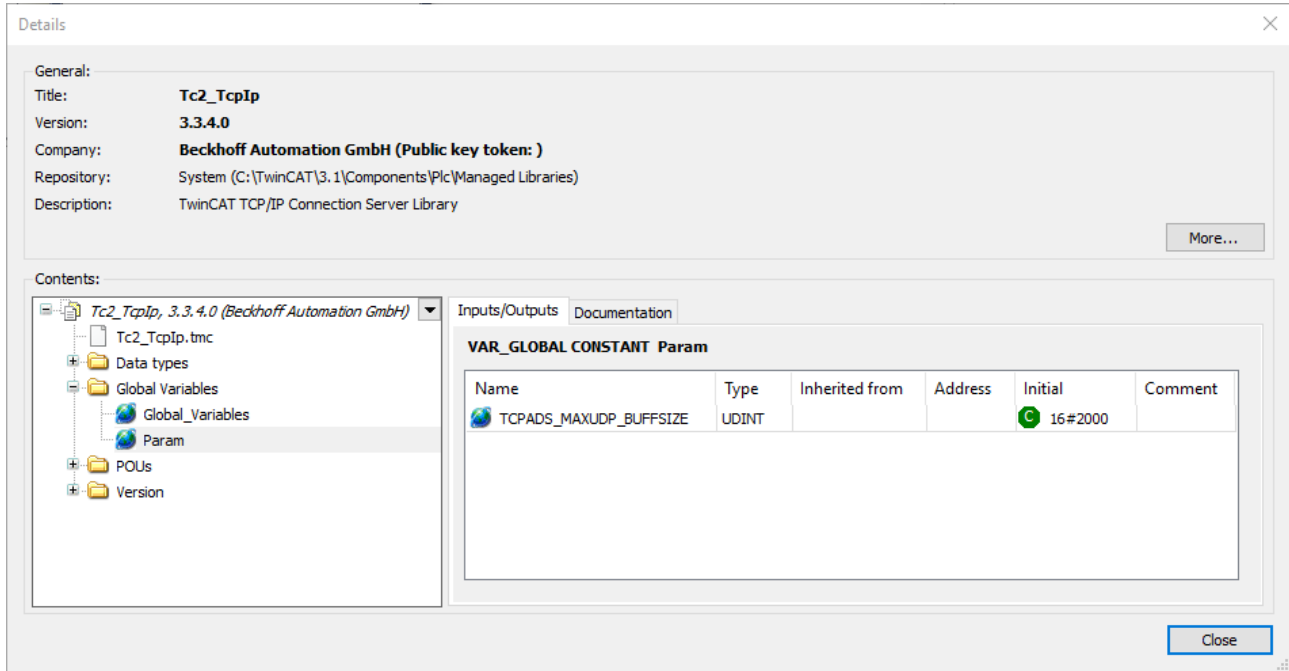

```
VAR_GLOBAL CONSTANT
  TCPADS_MAXUDP_BUFFSIZE : UDINT := 32000;
END_VAR
```

2) Activate the **Replace constants** option in the TwinCAT PLC Control dialog window (Project > Options ... > Build).

3) Rebuild your project.

TwinCAT 3

In TwinCAT 3, this value can be edited via a parameter list of the PLC library (from version 3.3.4.0).

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
  sRemoteHost : T_IPv4Addr := '';
  nRemotePort : UDINT;
  nRecBytes  : UDINT;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId : If the bError output is set, this parameter returns the TwinCAT TCP/IP Connection Server error number [▶ 88].

sRemoteHost: If successful, IP address (Ipv4) of the remote device whose data were received.

nRemotePort: If successful, IP port number of the remote device whose data were received (e.g. 200).

nRecBytes: Number of the last successfully received data bytes.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_TcpIp (communication)

5.1.11 FB_SocketUdpAddMulticastAddress

Binds the Server to a Multicast IP address so that Multicast UDP packets can be received. This function blocks requires a previously established UDP socket handle, which can be requested using the function block [FB_SocketUdpCreate](#) [▶ 29].

VAR_INPUT

```
VAR_INPUT
    sSrvNetId      : T_AmsNetId := '';
    hSocket        : T_HSOCKET;
    sMulticastAddr : STRING(15);
    bExecute       : BOOL;
    tTimeout       : TIME := T#5s;
END_VAR
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

hSocket: [Connection handle](#) [▶ 49] of the listener sockets. This handle must first be requested via the function block [FB_SocketUdpCreate](#) [▶ 29].

sMulticastAddr: Multicast address to bind to.

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

VAR_OUTPUT

```
VAR_OUTPUT
    bBusy      : BOOL;
    bError     : BOOL;
    nErrId     : UDINT;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId : If the bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [▶ 88].

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.12 FB_SocketUdpDropMulticastAddress

Removes the binding to a Multicast IP address, which has been added previously via the function block [FB_SocketUdpAddMulticastAddress](#) [▶ 34].

VAR_INPUT

```
VAR_INPUT
  sSrvNetId      : T_AmsNetId := '';
  hSocket        : T_HSOCKET;
  sMulticastAddr : STRING(15);
  bExecute       : BOOL;
  tTimeout       : TIME := T#5s;
END_VAR
```

sSrvNetId: String containing the network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

hSocket: [Connection handle](#) [▶ 49] of the listener sockets. This handle must first be requested via the function block [FB_SocketUdpCreate](#) [▶ 29].

sMulticastAddr: Multicast address for which the binding should be removed.

bExecute: The block is activated by a rising edge at this input.

tTimeout: Maximum time allowed for the execution of the function block.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an error occurs during the transfer of the command, this output is set once the bBusy output was reset.

nErrId : If the bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [▶ 88].

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_TcpIp (communication)

5.1.13 Helper

5.1.13.1 FB_ClientServerConnection

The function block FB_ClientServerConnection can be used to manage (establish or remove) a client connection. FB_ClientServerConnection simplifies the implementation of a client application by encapsulating the functionality of the two function blocks FB_SocketConnect [▶ 21] and FB_SocketClose [▶ 22] internally. The integrated debugging output of the connection status facilitates troubleshooting in the event of configuration or communication errors. In addition, a minimum client application only requires an instance of the FB_SocketSend [▶ 26] function block and/or an instance of the FB_SocketReceive [▶ 27] function block.

In the first step, a typical client application establishes the connection with the server via the FB_ClientServerConnection function block. In the next step instances of FB_SocketSend and/or FB_SocketReceive can be used to exchange data with the server. When a connection is closed depends on the requirements of the application.

VAR_INPUT

```
VAR_INPUT
  sSrvNetID   : T_AmsNetID := '';
  nMode       : DWORD := 0;
  sRemoteHost : T_IPv4Addr := '';
  nRemotePort : UDINT;
  bEnable     : BOOL;
  tReconnect  : TIME := T#45s; (*!!!*)
END_VAR
```

sSrvNetID: String containing the AMS network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

nMode: Parameter flags (modes). The permissible parameters are listed in the table and can be combined via an OR operation:

Flag	Description
CONNECT_MODE_ENABLEDBG	Activates logging of debugging messages in the application log. In order to view the debugging messages open the TwinCAT System Manager and activate log view.

sRemoteHost: IP address (Ipv4) of the remote server as a string (e.g. '172.33.5.1'). An empty string can be entered on the local computer for a server.

nRemotePort: IP port number of the remote server (e.g. 200).

bEnable: As long as this input is TRUE, the system attempts to establish a connection at regular intervals until a connection was established successfully. Once established, a connection can be closed again with FALSE.

tReconnect: Cycle time used by the function block to try and establish the connection.

Note

Cycle time setup

The tReconnect value should not be set too low, since timeout periods of >30s may occur in the event of a network interruption. If the value is too low, command execution would be interrupted prematurely, and ADS error code 1861 (timeout elapsed) would be returned instead of the Winsocket error WSAETIMEDOUT.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
  hSocket    : T_HSOCKET;
  eState     : E_SocketConnectionState := eSOCKET_DISCONNECTED;
END_VAR
```

bBusy: TRUE as long as the function block is active.

bError: TRUE as soon as an error has occurred.

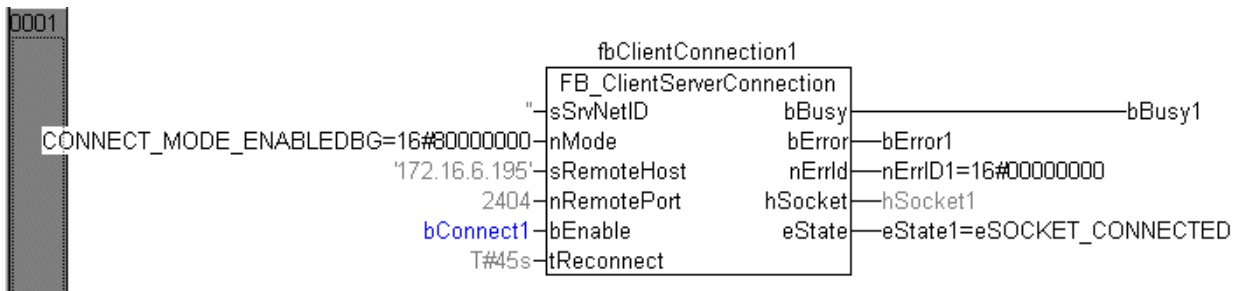

nErrID: If the bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [► 88].

hSocket: [Connection handle](#) [► 49] for the newly opened local client socket. If successful, this variable is transferred to the instances of the function blocks [FB_SocketSend](#) [► 26] and/or [FB_SocketReceive](#) [► 27].

eState: Returns the current [connection status](#) [► 46].

Example of a call in FBD

```
PROGRAM MAIN
VAR
  fbClientConnection1 : FB_ClientServerConnection;
  bConnect1           : BOOL;
  bBusy1              : BOOL;
  bError1             : BOOL;
  nErrID1             : UDINT;
  hSocket1            : T_HSOCKET;
  eState1             : E_SocketConnectionState;
END_VAR
```

Further application examples (including source code) can be found here: [Samples](#) [► 52]

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.13.2 FB_ServerClientConnection

The function block `FB_ServerClientConnection` can be used to manage (establish or remove) a server connection. `FB_ServerClientConnection` simplifies the implementation of a server application by encapsulating the functionality of the three function blocks `FB_SocketListen` [► 24], `FB_SocketAccept` [► 25] and `FB_SocketClose` [► 22] internally. The integrated debugging output of the connection status facilitates troubleshooting in the event of configuration or communication errors. In addition, a minimum server application only requires an instance of the `FB_SocketSend` [► 26] function block and/or an instance of the `FB_SocketReceive` [► 27] function block.

In the first step, a typical server application establishes the connection with the client via the `FB_ServerClientConnection` function block (more precisely, the server application accepts the incoming connection request). In the next step, instances of `FB_SocketSend` and/or `FB_SocketReceive` can be used to exchange data with the server. When a connection is closed depends on the requirements of the application.

VAR_IN_OUT

```
VAR_IN_OUT
  hServer      : T_HSERVER;
END_VAR
```

hServer: Server handle [► 48]. This input variable has to be initialized via the `F_CreateServerHnd` [► 42] function.

VAR_INPUT

```
VAR_INPUT
  eMode        : E_SocketAcceptMode := eACCEPT_ALL;
  sRemoteHost  : T_IPv4Addr := '';
  nRemotePort  : UDINT := 0;
  bEnable      : BOOL;
  tReconnect   : TIME := T#1s;
END_VAR
```

eMode: Determines whether all or only certain connections should be accepted [► 46].

sRemoteHost: IP address (Ipv4) of the remote client whose connection is to be accepted as a string (e.g. '172.33.5.1'). For a client on the local computer an empty string may be specified.

nRemotePort: IP port number of the remote client whose connection is to be accepted (e.g. 200).

bEnable: As long as this input is TRUE, the system attempts to establish a connection at regular intervals until a connection was established successfully. Once established, a connection can be closed again with FALSE.

tReconnect: Cycle time used by the function block to try and establish a connection.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy        : BOOL;
  bError       : BOOL;
  nErrID       : UDINT;
  hSocket      : T_HSOCKET;
  eState       : E_SocketConnectionState := eSOCKET_DISCONNECTED;
END_VAR
```

bBusy: TRUE as long as the function block is active.

bError: TRUE as soon as an error has occurred.

nErrId : If the `bError` output is set, this parameter returns the TwinCAT TCP/IP Connection Server error number [► 88].

hSocket: Connection handle [► 49] for the newly opened remote client socket. If successful, this variable is transferred to the instances of the function blocks `FB_SocketSend` [► 26] and/or `FB_SocketReceive` [► 27].

eState: Returns the current connection status [► 46].

Example in FBD

The following example illustrates initialization of a server handle variable. The server handle is then transferred to three instances of the FB_ServerClientConnection function block.

```
PROGRAM MAIN
VAR
  hServer          : T_HSERVER;
  bListen          : BOOL;

  fbServerConnection1 : FB_ServerClientConnection;
  bConnect1        : BOOL;
  bBusy1           : BOOL;
  bError1          : BOOL;
  nErrID1          : UDINT;
  hSocket1         : T_HSOCKET;
  eState1          : E_SocketConnectionState;

  fbServerConnection2 : FB_ServerClientConnection;
  bConnect2        : BOOL;
  bBusy2           : BOOL;
  bError2          : BOOL;
  nErrID2          : UDINT;
  hSocket2         : T_HSOCKET;
  eState2          : E_SocketConnectionState;

  fbServerConnection3 : FB_ServerClientConnection;
  bConnect3        : BOOL;
  bBusy3           : BOOL;
  bError3          : BOOL;
  nErrID3          : UDINT;
  hSocket3         : T_HSOCKET;
  eState3          : E_SocketConnectionState;
END_VAR
```

Online View:

The first connection is activated (`bConnect1 = TRUE`), although the connection has not yet been established (passive open).

The second connection has not yet been activated (`bConnect2 = FALSE`) (closed).

The third connection was activated (`bConnect3 = TRUE`), and a connection to the remote client has been established.

Further application examples (including source code) can be found here: [Samples](#) [► 52]

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.1.13.3 FB_ConnectionlessSocket

A UDP socket can be managed (opened/generated and closed) with the function block FB_ConnectionlessSocket. FB_ConnectionlessSocket simplifies the implementation of a UDP application by encapsulating the functionality of the two function blocks FB_SocketUdpCreate [▶ 29] and FB_SocketClose [▶ 22] internally. The integrated debugging output of the socket status facilitates troubleshooting in the event of configuration or communication errors. In addition, a minimum UDP application only requires an instance of the FB_SocketUdpSendTo [▶ 30] function block and/or an instance of the FB_SocketUdpReceiveFrom [▶ 32] function block.

In the first step, a typical UDP application opens a connection-less UDP socket with the FB_ConnectionlessSocket function block. In the next step, instances of FB_SocketUdpSendTo and/or FB_SocketUdpReceiveFrom can be used for exchanging data with another communication device. When a UDP socket is closed depends on the requirements of the application (e.g. in the event of a communication error).

VAR_INPUT

```
VAR_INPUT
  sSrvNetID   : T_AmsNetID := '';
  nMode       : DWORD := 0;
  sLocalHost  : T_IPv4Addr := '';
  nLocalPort  : UDINT;
  bEnable     : BOOL;
  tReconnect  : TIME := T#45s;(*!!!*)
END_VAR
```

sSrvNetID: String containing the AMS network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

nMode: Parameter flags (modes). The permissible parameters are listed in the table and can be combined via an OR operation:

Flag	Description
CONNECT_MODE_ENABLEDBG	Activates logging of debugging messages in the application log. In order to view the debugging messages open the TwinCAT System Manager and activate log view.

sLocalHost: IP address (Ipv4) of the local network adapter as a string (e.g. '172.33.5.1'). An empty string may be specified for the default network adapter.

nLocalPort: IP port number on the local computer (e.g. 200).

bEnable: As long as this input is TRUE, the system cyclically tries to open a UDP socket until a connection has been established. An open UDP socket can be closed again with FALSE.

tReconnect: Cycle time with which the function block tries to open the UDP socket.

 Note	<p>Cycle time setup</p> <p>The tReconnect value should not be set too low, since timeout periods of >30s may occur in the event of a network interruption. If the value is too low, command execution would be interrupted prematurely, and ADS error code 1861 (timeout elapsed) would be returned instead of the Winsocket error WSAETIMEDOUT.</p>
--	--

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
  hSocket    : T_HSOCKET;
  eState    : E_SocketConnectionlessState := eSOCKET_CLOSED;
END_VAR
```

bBusy: TRUE as long as the function block is active.

bError: TRUE if an error code occurs.

nErrId: If an bError output is set, this parameter returns the [TwinCAT TCP/IP Connection Server error number](#) [[▶ 88](#)].

hSocket: The [connection handle](#) [[▶ 49](#)] to the newly opened UDP socket. If successful, this variable is transferred to the instances of the function blocks [FB_SocketUdpSendTo](#) [[▶ 30](#)] and/or [FB_SocketUdpReceiveFrom](#) [[▶ 32](#)].

eState: Returns the current [connection status](#) [[▶ 46](#)].

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.2 Functions

5.2.1 F_CreateServerHnd

The function `F_CreateServerHnd` is used to initialise/set the internal parameters of a server handle variable `hServer`. The server handle is then transferred to the instances of the [FB_ServerClientConnection](#) [[▶ 37](#)] function block via `VAR_IN_OUT`. An instance of the `FB_ServerClientConnection` function block can be used to manage (establish or remove) a sever connection in a straightforward manner. The same server handle can be transferred to several instances of the `FB_ServerClientConnection` function block, in order to enable the server to establish several concurrent connections.

FUNCTION F_CreateServerHnd : BOOL

```
VAR_IN_OUT
  hServer      : T_HSERVER;
END_VAR
VAR_INPUT
  sSrvNetID    : T_AmsNetID := '';
  sLocalHost   : STRING(15) := '';
  nLocalPort   : UDINT := 0;
  nMode        : DWORD := LISTEN_MODE_CLOSEALL (* OR CONNECT_MODE_ENABLEDBG*);
  bEnable      : BOOL := TRUE;
END_VAR
```

hServer: [Server handle](#) [[▶ 48](#)] variable whose internal parameters are to be initialized.

sSrvNetID: String containing the AMS network address of the TwinCAT TCP/IP Connection Server. For the local computer (default) an empty string may be specified.

sLocalHost: Local server IP address (Ipv4) as a string (e.g. '172.13.15.2'). For a server on the local computer (default), an empty string may be entered.

nLocalPort: Local server IP port (e.g. 200).

nMode: Parameter flags (modes). The permissible parameters are listed in the table and can be combined via an OR operation:

Flag	Description
LISTEN_MODE_CLOSEALL	All previously opened socket connections are closed (default).
CONNECT_MODE_ENABLEDBG	Activates logging of debugging messages in the application log. In order to view the debugging messages open the TwinCAT System Manager and activate log view.

bEnable: This input determines the behavior of the listener socket. Once opened, a listener socket remains open until this input becomes TRUE. If this input is FALSE, the listener socket is closed automatically, but only once the last (previously) accepted connection was also closed.

Return value	Description
TRUE	No error
FALSE	Error, invalid parameter value

Example:

See [FB_ServerClientConnection](#) [► 37]

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.2.2 HSOCKET_TO_STRING

The function converts the connection handle of type T_HSOCKET to a string (e.g. for debug outputs).

The returned string has the following format: "Handle:0xA[BCD] Local:a[aa].b[bb].c[cc].d[dd]:port Remote:a[aa].b[bb].c[cc].d[dd]:port".

Example: "Handle:0x4001 Local:172.16.6.195:28459 Remote:172.16.6.180:2404"

FUNCTION HSOCKET_TO_STRING : STRING

```
VAR_INPUT
  hSocket : T_HSOCKET;
END_VAR
```

hSocket: [Connection handle](#) [► 49] to be converted.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.2.3 HSOCKET_TO_STRINGEX

The function converts the connection handle of type T_HSOCKET to a string (e.g. for debug outputs).

The returned string has the following format: "Handle:0xA[BCD] Local:a[aa].b[bb].c[cc].d[dd]:port Remote:a[aa].b[bb].c[cc].d[dd]:port".

Example: "Handle:0x4001 Local:172.16.6.195:28459 Remote:172.16.6.180:2404"

The parameters bLocal and bRemote determine whether the local and/or remote address information should be included in the returned string.

FUNCTION HSOCKET_TO_STRINGEX : STRING

```
VAR_INPUT
  hSocket : T_HSOCKET;
  bLocal  : BOOL;
  bRemote : BOOL;
END_VAR
```

hSocket: The connection handle [▶ 49] to be converted.

bLocal: TRUE: Include the local address, FALSE: Exclude the local address.

bRemote: TRUE: Include the remote address, FALSE: Exclude the remote address.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.2.4 SOCKETADDR_TO_STRING

The function converts a variable of type ST_SockAddr to a string (e.g. for debug outputs).

The returned string has the following format: "a[aa].b[bb].c[cc].d[dd]:port"

Example: "172.16.6.195:80"

FUNCTION SOCKETADDR_TO_STRING : STRING

```
VAR_INPUT
  stSockAddr : ST_SockAddr;
END_VAR
```

stSockAddr: The variable to be converted.

See ST_SockAddr [▶ 48]

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.2.5 [Obsolete]

5.2.5.1 F_GetVersionTcplp

This function can be used to read PLC library version information.

FUNCTION F_GetVersionTcplp : UINT

```
VAR_INPUT
    nVersionElement : INT;
END_VAR
```

nVersionElement : Version element to be read. Possible parameters:

- 1 : major number;
- 2 : minor number;
- 3 : revision number;

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.2.5.2 F_GetVersionTcSocketHelper

This function reads version information from the PLC library.

FUNCTION F_GetVersionTcSocketHelper : UINT

```
VAR_INPUT
    nVersionElement : INT;
END_VAR
```

nVersionElement : Version element, that is to be read. Possible parameters:

- 1 : major number;
- 2 : minor number;
- 3 : revision number;

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.3 Data types

5.3.1 E_SocketAcceptMode

```

TYPE E_SocketAcceptMode:
(* Connection accept modes *)
(
  eACCEPT_ALL, (* Accept connection to all remote clients *)
  eACCEPT_SEL_HOST, (* Accept connection to selected host address *)
  eACCEPT_SEL_PORT, (* Accept connection to selected port address *)
  eACCEPT_SEL_HOST_PORT (* Accept connection to selected host and port address *)
);
END_TYPE

```

The variable E_SocketAcceptMode defines which connections are to be accepted by a server.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.3.2 E_SocketConnectionState

```

TYPE E_SocketConnectionState:
(
  eSOCKET_DISCONNECTED,
  eSOCKET_CONNECTED,
  eSOCKET_SUSPENDED
);
END_TYPE

```

TCP/IP Socket Connection Status (eSOCKET_SUSPENDED == the status changes e.g. from eSOCKET_CONNECTED => eSOCKET_DISCONNECTED).

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.3.3 E_SocketConnectionlessState

```

TYPE E_SocketConnectionlessState:
(
  eSOCKET_CLOSED,
  eSOCKET_CREATED,
  eSOCKET_TRANSIENT
);
END_TYPE

```

Status information of a connection-less UDP socket (eSOCKET_TRANSIENT == the status changes from eSOCKET_CREATED => eSOCKET_CLOSED, for example).

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.3.4 E_WinsockError

```

TYPE E_WinsockError :
(
  WSOK,
  WSAEINTR      := 10004 ,(* A blocking operation was interrupted by a call to WSACancelBlock-
ingCall. *)
  WSAEBADF      := 10009 ,(* The file handle supplied is not valid. *)
  WSAEACCES     := 10013 ,(* An attempt was made to access a socket in a way forbidden by its ac-
cess permissions. *)
  WSAEFAULT     := 10014 ,(* The system detected an invalid pointer address in attempt-
ing to use a pointer argument in a call. *)

WSANO_DATA := 11004 ,(* The requested name is valid and was found in the database, but it does not have the correct associated data being resolved for. *)
);
END_TYPE

```

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.3.5 ST_SockAddr

Structure with address information for an open socket.

```

TYPE ST_SockAddr : (* Local or remote endpoint address *)
STRUCT
  nPort : UDINT; (* Internet Protocol (IP) port. *)
  sAddr : STRING(15); (* String containing an (Ipv4) Internet Protocol dotted address. *)
END_STRUCT
END_TYPE

```

nPort: Internet Protocol (IP) port

sAddr: Internet protocol address (Ipv4) separated by dots as a string, e.g. "172.34.12.3"

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.3.6 T_HSERVER

The variable of this type represents a TCP/IP Server Handle. The Handle has to be initialized with `F_CreateServerHnd` [▶ 42] befor it can be used. In doing so the internal parameters of variables `T_HSERVER` are set.

**Note****Preserve the default structure elements**

The structure elements are not to be written or changed.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.3.7 T_HSOCKET

Variables of this type represent a connection handle or a handle of an open socket. Via this handle, data can be sent to or received from a socket. The handle can be used to close an open socket.

```

TYPE T_HSOCKET
STRUCT
  handle      : UDINT;
  localAddr   : ST_SockAddr; (* Local address *)
  remoteAddr  : ST_SockAddr; (* Remote endpoint address *)
END_STRUCT
END_TYPE

```

handle: Internal TwinCAT TCP/IP Connection Server socket handle;

localAddr: Local [socket address](#) [► 48];

remoteAddr: Remote [socket address](#) [► 48];

The following sockets can be opened and closed via the TwinCAT TCP/IP Connection Server: listener socket, remote client socket, or local client socket. Depending on which of these sockets was opened by the TwinCAT TCP/IP Connection Server, suitable address information is entered into the localAddr and remoteAddr variables.

Connection handle on the server side

- The function block [FB_SocketListen](#) [► 24] opens a listener socket and returns the connection handle of the listener socket.
- The connection handle of the listener sockets is transferred to the function block [FB_SocketAccept](#) [► 25]. [FB_SocketAccept](#) will then return the connection handles of the remote clients.
- The function block [FB_SocketAccept](#) returns a new connection handle for each connected remote client.
- The connection handle is then transferred to the function blocks [FB_SocketSend](#) [► 26] and/or [FB_SocketReceive](#) [► 27], in order to be able to exchange data with the remote clients.
- A connection handle of a remote client that is not desirable or no longer required is transferred to the function block [FB_SocketClose](#) [► 22], which closes the remote client socket.
- A listener socket connection handle that is no longer required is also transferred to the function block [FB_SocketClose](#), which closes the listener socket.

Connection handle on the client side

- The function block [FB_SocketConnect](#) [► 21] returns the connection handle of a local client socket.
- The connection handle is then transferred to the function blocks [FB_SocketSend](#) [► 26] and [FB_SocketReceive](#) [► 27], in order to be able to exchange data with a remote server.
- The same connection handle is then transferred to the function block [FB_SocketClose](#) [► 22], in order to close a connection that is no longer required.

The function block `FB_SocketCloseAll` [▶ 23] can be used to close all connection handles (sockets) that were opened by a PLC runtime system. This means that, if `FB_SocketCloseAll` is called in one of the tasks of the first runtime systems (port 801), all sockets that were opened in the first runtime system are closed.

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.4 Global constants

END_VAR
    
```

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

5.4.2 Library version

All libraries have a specific version. This version is shown in the PLC library repository too. A global constant contains the library version information:

Global_Version

```

VAR_GLOBAL CONSTANT
  stLibVersion_Tc2_TcpIp : ST_LibVersion;
END_VAR
    
```

To compare the existing version to a required version the function `F_CmpLibVersion` (defined in `Tc2_System` library) is offered.

**Note****TwinCAT 2 compatibility**

All other possibilities known from TwinCAT2 libraries to query a library version are obsolete!

Requirements

Development environment	Target system type	PLC libraries to include (category group)
TwinCAT v3.1.0	PC, or CX (x86, X64, ARM)	Tc2_Tcplp (communication)

6 Samples

6.1 TCP

6.1.1 Sample01: "Echo" client/server (base blocks)

6.1.1.1 Overview

The following example shows an implementation of an "echo" client/server. The client sends a test string to the server at certain intervals (e.g. every second). The remote server then immediately resends the same string to the client.

In this sample, the client is implemented in the PLC and as a .NET application written in C#. The PLC client can create several instances of the communication, simulating several TCP connections at once. The .NET sample client only establishes one concurrent connection. The server is able to communicate with several clients.

In addition, several instances of the server may be created. Each server instance is then addressed via a different port number which can be used by the client to connect to a specific server instance. The server implementation is more difficult if the server has to communicate with more than one client.

Feel free to use and customize this sample to your needs.

System requirements

- TwinCAT 3 Build 3093 or higher
- TwinCAT 3 Function TF6310 TCP/IP
- If two computers are used to execute the sample (one client and one server), the Function TF6310 needs to be installed on both computers
- If one computer is used to execute the sample, e.g. client and server running in two separate PLC runtimes, both PLC runtimes need to run in separate tasks
- To run the .NET sample client, only .NET Framework 4.0 is needed

Project downloads

This sample consists of three components (PLC client, PLC server and .NET client), which can be downloaded in a .zip archive. The PLC samples are provided as TwinCAT 3 PLC project files. Before a PLC project can be imported into TwinCAT XAE, a TwinCAT 3 Solution must first be created. The PLC project can then be added to the solution via the command **Add Existing Item** in the context menu of the PLC node.

Download: [TcpIpServer_TCP_Sample01.zip](#)

Project description

The following links provide documentation for the three components. Additionally, an own article explains how to start the PLC samples with step-by-step instructions.

- [Integration in TwinCAT and Test \[▶ 54\]](#) (Starting the PLC samples)
- [PLC Client \[▶ 57\]](#) (PLC client documentation: [FB_LocalClient function block \[▶ 57\]](#))
- [PLC Server \[▶ 61\]](#) (PLC serve documentation: [FB_LocalServer function block \[▶ 61\]](#))
- [.NET client \[▶ 67\]](#) (.NET client documentation: [.NET sample client \[▶ 67\]](#))

Auxiliary functions in the PLC sample projects

In the example projects, several functions, constants and function blocks are used, which are briefly described below:

LogError function

FUNCTION LogError : DINT

The function writes a message with the error code into the log book of the operating system (Event Viewer). The global variable bLogDebugMessages must first be set to TRUE.

LogMessage function

FUNCTION LogMessage : DINT

The function writes a message into the log book of the operating system (Event Viewer) if a new socket was opened or closed. The global variable bLogDebugMessages must first be set to TRUE.

SCODE_CODE function

FUNCTION SCODE_CODE : DWORD

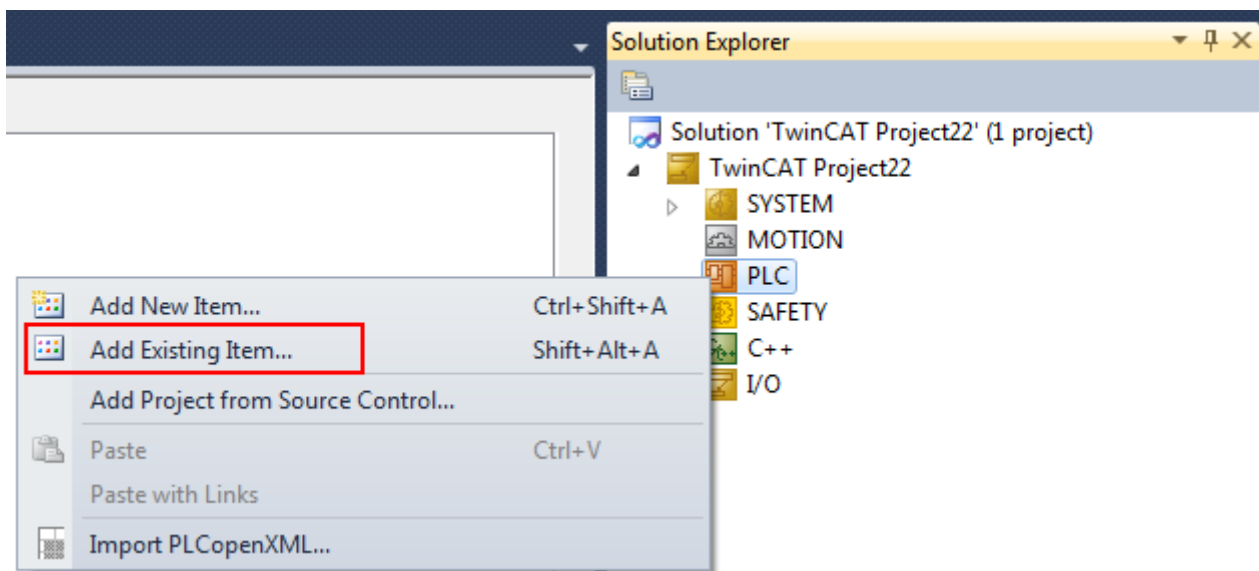

The function masks the lower 16 bits of a Win32 error code returns them.

Global variables

Name	Default value	Description
bLogDebugMessages	TRUE	Activates/deactivates writing of messages into the log book of the operating system
MAX_CLIENT_CONNECTIONS	5	Max. number of remote clients, that can connect to the server at the same time.
MAX_PLCPRJ_RXBUFFER_SIZE	1000	Max. length of the internal receive buffer
PLCPRJ_RECONNECT_TIME	T#3s	Once this time has elapsed, the local client will attempt to re-establish the connection with the remote server
PLCPRJ_SEND_CYCLE_TIME	T#1s	The test string is sent cyclically at these intervals from the local client to the remote server
PLCPRJ_RECEIVE_POLLING_TIME	T#1s	The client reads (polls) data from the server using this cycle
PLCPRJ_RECEIVE_TIMEOUT	T#10s	After this time has elapsed, the local client aborts the reception if no data bytes could be received during this time
PLCPRJ_ERROR_RECEIVE_BUFFER_OVERFLOW	16#8101	Sample project error code: Too many characters without zero termination were received
PLCPRJ_ERROR_RECEIVE_TIMEOUT	16#8102	Sample project error code: No new data could be received within the timeout time (PLCPRJ_RECEIVE_TIMEOUT)

6.1.1.2 Integration in TwinCAT and Test

The following section describes how to prepare and start the PLC server and client. The PLC samples are delivered as TwinCAT 3 PLC project files. To import a PLC project into TwinCAT XAE, first create a new TwinCAT 3 Solution. Then select the command **Add Existing Item** in the context menu of the PLC node and select the downloaded sample file (*Plc 3.x Project archive (*.tpzip)* as file type) in the dialog that opens. After confirming the dialog, the PLC project is added to the solution.

PLC server sample

Create a new TwinCAT 3 solution in TwinCAT XAE and import the TCP/IP server project. Select a target system. Make sure that you have created licenses for TF6310 and that the Function is also installed on the selected target system. Leave the TwinCAT 3 solution open.

```

PROGRAM MAIN
VAR
    fbServer          : FB_LocalServer := ( sLocalHost := '127.0.0.1' (*own IP address!*), nLocal-
Port := 200 );
    bEnableServer     : BOOL := TRUE;
    fbSocketCloseAll : FB_SocketCloseAll := ( sSrvNetID := '', tTimeout := DEFAULT_ADS_TIMEOUT );
    bCloseAll         : BOOL := TRUE;
END_VAR

IF bCloseAll THEN (*On PLC reset or program download close all old connections *)
    bCloseAll := FALSE;
    fbSocketCloseAll( bExecute:= TRUE );
ELSE
    fbSocketCloseAll( bExecute:= FALSE );
END_IF

IF NOT fbSocketCloseAll.bBusy THEN
    fbServer( bEnable := bEnableServer );
END_IF

```

PLC client sample

In the same TwinCAT 3 solution, import the TCP/IP client project as a second PLC project. Link this PLC project to another task than the server sample. The server's IP address has to be adapted to your remote system (initialization values of the sRemoteHost variables). In this case, the server is located on the same machine, therefore enter 127.0.0.1. Activate the configuration, then login and start both PLC projects, beginning with the server.

```

PROGRAM MAIN
VAR
    fbClient1        : FB_LocalClient := ( sRemoteHost:= '127.0.0.1' (* IP address of re-
mote server! *), nRemotePort:= 200 );
    fbClient2        : FB_LocalClient := ( sRemoteHost:= '127.0.0.1', nRemotePort:= 200 );
    fbClient3        : FB_LocalClient := ( sRemoteHost:= '127.0.0.1', nRemotePort:= 200 );
    fbClient4        : FB_LocalClient := ( sRemoteHost:= '127.0.0.1', nRemotePort:= 200 );
    fbClient5        : FB_LocalClient := ( sRemoteHost:= '127.0.0.1', nRemotePort:= 200 );

    bEnableClient1   : BOOL := TRUE;
    bEnableClient2   : BOOL := FALSE;
    bEnableClient3   : BOOL := FALSE;
    bEnableClient4   : BOOL := FALSE;
    bEnableClient5   : BOOL := FALSE;

    fbSocketCloseAll : FB_SocketCloseAll := ( sSrvNetID := '', tTimeout := DEFAULT_ADS_TIMEOUT );
    bCloseAll        : BOOL := TRUE;

    nCount           : UDINT;
END_VAR

IF bCloseAll THEN (*On PLC reset or program download close all old connections *)
    bCloseAll := FALSE;
    fbSocketCloseAll( bExecute:= TRUE );
ELSE
    fbSocketCloseAll( bExecute:= FALSE );
END_IF

IF NOT fbSocketCloseAll.bBusy THEN
    nCount := nCount + 1;
    fbClient1( bEnable := bEnableClient1, sToServer := CON-
CAT( 'CLIENT1-', UDINT_TO_STRING( nCount ) ) );
    fbClient2( bEnable := bEnableClient2, sToServer := CON-
CAT( 'CLIENT2-', UDINT_TO_STRING( nCount ) ) );
    fbClient3( bEnable := bEnableClient3, sToServer := CON-
CAT( 'CLIENT3-', UDINT_TO_STRING( nCount ) ) );
    fbClient4( bEnable := bEnableClient4 );
    fbClient5( bEnable := bEnableClient5 );
END_IF

```

Up to five client instances can be activated by setting the bEnableClientX variable. Each client sends a string (default: 'TEST') to the server approximately every second. The server returns the same string to the client (echo). For the test, a string with a counter value is generated automatically for the first three instances. The first client is activated automatically when the program is started. Set the bEnableClient4 variable in the client project to TRUE. The new client instance will then attempt to establish a connection with the server. If successful, the 'TEST' string is sent cyclically. Now open the fbClient4 instance of the FB_LocalClient function block. Double-click to open the dialog for writing the sToString variable. Change the value of the string variable, for example to 'Hello'.

Expression	Type	Value	Prepared value
fbClient1	FB_LocalClient		
fbClient2	FB_LocalClient		
fbClient3	FB_LocalClient		
fbClient4	FB_LocalClient		
sRemoteHost	STRING(15)	'127.0.0.1'	
nRemotePort	UDINT	200	
sToServer	STRING(255)	'Test'	'Hello World'
bEnable	BOOL	TRUE	
bConnected	BOOL	TRUE	
hSocket	T_HSOCKET		
bBusy	BOOL	TRUE	
bError	BOOL	FALSE	
nErrId	UDINT	0	
sFromServer	STRING(255)	'Test'	

Close the dialog with **OK**. Write the new value into the PLC. Shortly afterwards, the value is send back by the server can also be seen online.

Expression	Type	Value	Prepared value
fbClient1	FB_LocalClient		
fbClient2	FB_LocalClient		
fbClient3	FB_LocalClient		
fbClient4	FB_LocalClient		
sRemoteHost	STRING(15)	'127.0.0.1'	
nRemotePort	UDINT	200	
sToServer	STRING(255)	'Hello World'	
bEnable	BOOL	TRUE	
bConnected	BOOL	TRUE	
hSocket	T_HSOCKET		
bBusy	BOOL	TRUE	
bError	BOOL	FALSE	
nErrId	UDINT	0	
sFromServer	STRING(255)	'Hello World'	

Now open the fbServer instance of the FB_LocalServer function block in the server project. Our string: 'Hello' can be seen in the online data of the server.

Expression	Type	Value	Prepared value
fbRemoteClient	ARRAY [1..MAX_CLI...		
fbRemoteClient[1]	FB_RemoteClient		
fbRemoteClient[2]	FB_RemoteClient		
fbRemoteClient[3]	FB_RemoteClient		
fbRemoteClient[4]	FB_RemoteClient		
hListener	T_HSOCKET		
bEnable	BOOL	TRUE	
bAccepted	BOOL	FALSE	
hSocket	T_HSOCKET		
bBusy	BOOL	TRUE	
bError	BOOL	FALSE	
nErrID	UDINT	0	
sFromClient	STRING(255)	'Hello World'	
fbAccept	FB_SocketAccept		

6.1.1.3 PLC Client

6.1.1.3.1 FB_LocalClient

If the bEnable input is set, the system will keep trying to establish the connection to the remote server once the PLCPRJ_RECONNECT_TIME has elapsed. The remote server is identified via the sRemoteHost IP address and the nRemotePort IP port address. The data exchange with the server was encapsulated in a separate function block (FB_ClientDataExchange [59]). Data exchange is always cyclic once PLCPRJ_SEND_CYCLE_TIME has elapsed. The sToServer string variable is sent to the server, and the string sent back by the server is returned at output sFormServer. Another implementation, in which the remote server is addressed as required is also possible. In the event of an error, the existing connection is closed, and a new connection is established.

Interface

```

FUNCTION_BLOCK FB_LocalClient
VAR_INPUT
  sRemoteHost      : STRING(15) := '127.0.0.1';(* IP adress of remote server *)
  nRemotePort      : UDINT := 0;
  sToServer        : T_MaxString:= 'TEST';
  bEnable          : BOOL;
END_VAR
VAR_OUTPUT

    END_IF
END_CASE
    
```

6.1.1.3.2 FB_ClientDataExcha

In the event of an rising edge at the *bExecute* input, a zero-terminated string is sent to the remote server, and a string returned by the remote server is read. The function block will try reading the data until zero termination was detected in the string received. Reception is aborted in the event of an error, and if no new data were received within the PLCPRJ_RECEIVE_TIMEOUT timeout time. Data are attempted to be read again after a certain delay time, if no new data could be read during the last read attempt. This reduces the system load.

Interface

```

FUNCTION_BLOCK FB_ClientDataExcha

6.1.1.4 PLC Server

6.1.1.4.1 FB_LocalServer

The server must first be allocated a unique sLocalHost IP address and an nLocalPort IP port number. If the bEnable input is set, the local server will repeatedly try to open the listener socket once the PLCPRJ_RECONNECT_TIME has elapsed. The listener socket can usually be opened at the first attempt, if the TwinCAT TCP/IP Connection Server resides on the local PC. The functionality of a remote client was encapsulated in the function block FB_RemoteClient [► 63]. The remote client instances are activated once the listener socket was opened successfully. Each instance of the FB_RemoteClient corresponds to a remote client, with which the local server can communicate simultaneously. The maximum number of remote clients communicating with the server can be modified via the value of the MAX_CLIENT_CONNECTIONS constant. In the event of an error, first all remote client connections are closed, followed by the listener sockets. The nAcceptedClients output provides information about the current number of connected clients.

Interface

```

FUNCTION_BLOCK FB_LocalServer

6.1.1.4.2 FB_RemoteClient

If the bEnable input is set, an attempt is made to accept the connection request of a remote client, once the PLCPRJ_ACCEPT_POOLING_TIME has elapsed. The data exchange with the remote client was encapsulated in a separate function block (FB_ServerDataExcha [▶ 65]). Once the connection was established successfully, the instance is activated via the FB_ServerDataExcha function block. In the event of an error, the accepted connection is closed, and a new connection is established.

6.1.1.4.3 FB_ServerDataExcha

In the event of an rising edge at the bExecute input, a zero-terminated string is read by the remote client and returned to the remote client, if zero termination was detected. The function block will try reading the data until zero termination was detected in the string received. Reception is aborted in the event of an error, and if no new data were received within the PLCPRJ_RECEIVE_TIMEOUT timeout time. Data are attempted to be read again after a certain delay time, if no new data could be read during the last read attempt. This reduces the system load.

6.1.1.5 .NET client

This project example shows how a client for the PLC TCP/IP server can be realized by writing a .NET4.0 application using C#.

This sample client makes use of the .NET libraries System.Net and System.Net.Sockets which enable a programmer easy access to socket functionalities. By pressing the button **Enable**, the application attempts to cyclically (depending on the value of TIMERTICK in [ms]) establish a connection with the server. If successful, a string with a maximum length of 255 characters can be sent to the server via the "Send" button. The server will then take this string and send it back to the client. On the server side, the connection is closed automatically if the server was unable to receive new data from the client within a defined period, as specified by PLCPRJ_RECEIVE_TIMEOUT in the server sample - by default 50 seconds.

6.1.2 Sample02: “Echo“ client /server

This sample is based on the functionality offered by the former TcSocketHelper.Lib, which is now part of Tc2_TcpIp library. It realizes a Client/Server PLC application based on the functionality provided by the former SocketHelper library.

The client cyclically sends a test string (sToServer) to the remote server. The server returns the same string unchanged to the client (sFromServer).

System requirements

- TwinCAT 3 Build 3093 or higher
- TwinCAT 3 Function TF6310 TCP/IP
- If two computers are used to execute the sample (one client and one server), the Function TF6310 needs to be installed on both computers
- If one computer is used to execute the sample, e.g. client and server running in two separate PLC runtimes, both PLC runtimes need to run in separate tasks.

Project downloads

The sample consists of two components (PLC client and PLC server), which can be downloaded in a .zip archive. Client and server are delivered in two own PLC applications in the form of TwinCAT 3 PLC project files. Before a PLC project can be imported into TwinCAT XAE, a TwinCAT 3 Solution must first be created. The PLC project can then be added to the solution via the command **Add Existing Item** in the context menu of the PLC node.

Download: [TcpIpServer_TCP_Sample02.zip](#)

Project information

The default communication settings used in the above samples are as follows:

- PLC client application: Port and IP address of the remote server: 200, '127.0.0.1'
- PLC server application: Port and IP address of the local server: 200, '127.0.0.1'

To test the client and server application on two different PCs, you have to adjust the port and the IP address accordingly.

However, you can also test the client and server samples with the default values on a single computer by loading the client application into the first PLC runtime system and the server application into the second PLC runtime system.

The behavior of the PLC project sample is determined by the following global variables/constants.

Constant	Value	Description
PLCPRJ_MAX_CONNECTIONS	5	Max. number of server → client connections. A server can establish connections to more than one client. A client can establish a connection to only one server at a time.
PLCPRJ_SERVER_RESPONSE_TIMEOUT	T#10s	Max. delay time (timeout time) after which a server should send a response to the client.
PLCPRJ_CLIENT_SEND_CYCLE_TIME	T#1s	Cycle time based on which a client sends send data (TX) to the server.
PLCPRJ_RECEIVER_POLLING_CYCLE_TIME	T#200ms	Cycle time based on which a client or server polls for receive data (RX).
PLCPRJ_BUFFER_SIZE	10000	Max. internal buffer size for RX/TX data.

The PLC samples define and use the following internal error codes:

Error code	Value	Description
PLCPRJ_ERROR_RECEIVE_BUFFER_OVERFLOW	16#8101	The internal receive buffer reports an overflow.
PLCPRJ_ERROR_SEND_BUFFER_OVERFLOW	16#8102	The internal send buffer reports an overflow.
PLCPRJ_ERROR_RESPONSE_TIMEOUT	16#8103	The server has not sent the response within the specified timeout time.
PLCPRJ_ERROR_INVALID_FRAME_FORMAT	16#8104	The telegram formatting is incorrect (size, faulty data bytes etc.).

The client and server applications (FB_ServerApplication, FB_ClientApplication) were implemented as function blocks. The application and the connection can thus be instanced repeatedly.

6.1.3 Sample03: “Echo” client/server

This sample is based on the functionality offered by the former TcSocketHelper.Lib, which is now part of Tc2_TcpIp library. It realizes a Client/Server PLC application based on the functionality provided by the former SocketHelper library.

The client cyclically sends a test string (sToServer) to the remote server. The server returns the same string unchanged to the client (sFromServer). The difference between this sample and sample02 is that the server can establish up to five connections and the client application may start five client instances. Each instance establishes a connection to the server.

System requirements

- TwinCAT 3 Build 3093 or higher
- TwinCAT 3 Function TF6310 TCP/IP
- If two computers are used to execute the sample (one client and one server), the Function TF6310 needs to be installed on both computers
- If one computer is used to execute the sample, e.g. client and server running in two separate PLC runtimes, both PLC runtimes need to run in separate tasks

Project downloads

The sample consists of two components (PLC client and PLC server), which can be downloaded in a .zip archive. Client and server are delivered in two own PLC applications in the form of TwinCAT 3 PLC project files. Before a PLC project can be imported into TwinCAT XAE, a TwinCAT 3 Solution must first be created. The PLC project can then be added to the solution via the command **Add Existing Item** in the context menu of the PLC node.

- PLC server application: Port and IP address of the local server: 200, '127.0.0.1'

To test the client and server application on two different PCs, you have to adjust the port and the IP address accordingly.

However, you can also test the client and server samples with the default values on a single computer by loading the client application into the first PLC runtime system and the server application into the second PLC runtime system.

The behavior of the PLC project sample is determined by the following global variables/constants.

Constant	Value	Description
PLCPRJ_MAX_CONNECTIONS	5	Max. number of server->client connections. A server can establish connections to more than one client. A client can establish a connection to only one server at a time.
PLCPRJ_SERVER_RESPONSE_TIMEOUT	T#10s	Max. delay time (timeout time) after which a server should send a response to the client.
PLCPRJ_CLIENT_SEND_CYCLE_TIME	T#1s	Cycle time based on which a client sends send data (TX) to the server.
PLCPRJ_RECEIVER_POLLING_CYCLE_TIME	T#200ms	Cycle time based on which a client or server polls for receive data (RX).
PLCPRJ_BUFFER_SIZE	10000	Max. internal buffer size for RX/TX data.

The PLC samples define and use the following internal error codes:

Error code	Value	Description
PLCPRJ_ERROR_RECEIVE_BUFFER_OVERFLOW	16#8101	The internal receive buffer reports an overflow.
PLCPRJ_ERROR_SEND_BUFFER_OVERFLOW	16#8102	The internal send buffer reports an overflow.
PLCPRJ_ERROR_RESPONSE_TIMEOUT	16#8103	The server has not sent the response within the specified timeout time.
PLCPRJ_ERROR_INVALID_FRAME_FORMAT	16#8104	The telegram formatting is incorrect (size, faulty data bytes etc.).

The client and server applications (FB_ServerApplication, FB_ClientApplication) were implemented as function blocks. The application and the connection can thus be instanced repeatedly.

6.1.4 Sample04: Binary data exchange

This sample is based on the functionality offered by the former TcSocketHelper.Lib, which is now part of Tc2_TcIp library. It realizes a Client/Server PLC application based on the functionality provided by the former SocketHelper library.

This sample offers a client-server application for the exchange of binary data. To achieve this, a simple sample protocol is implemented. The length of the binary data and a frame counter for the sent and received telegrams are transferred in the protocol header.

The structure of the binary data is defined by the PLC structure ST_ApplicationBinaryData. The binary data are appended to the headers and transferred. The instances of the binary structure are called toServer, fromServer on the client side and toClient, fromClient on the server side.

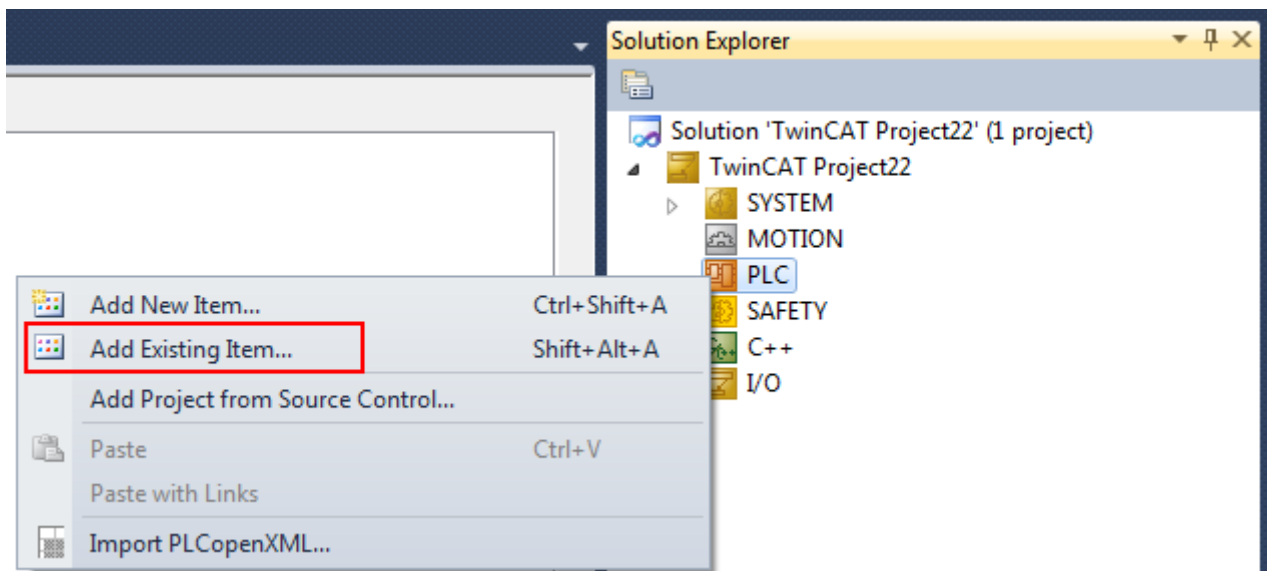

The structure declaration on the client and server sides can be adapted as required. The structure declaration must be identical on both sides.

The maximum size of the structure must not exceed the maximum buffer size of the send/receive Fifos. The maximum buffer size is determined by a constant.

The server functionality is implemented in the function block FB_ServerApplication and the client functionality in the function block FB_ClientApplication.

In the standard implementation the client cyclically sends the data of the binary structure to the server and waits for a response from the server. The server modifies some data and returns them to the client.

If you require a functionality, you have to modify the function blocks FB_ServerApplication and FB_ClientApplication accordingly.

System requirements

- TwinCAT 3 Build 3093 or higher
- TwinCAT 3 Function TF6310 TCP/IP
- If two computers are used to execute the sample (one client and one server), the Function TF6310 needs to be installed on both computers
- If one computer is used to execute the sample, e.g. client and server running in two separate PLC runtimes, both PLC runtimes need to run in separate tasks.

Project downloads

The sample consists of two components (PLC client and PLC server), which can be downloaded in a .zip archive. Client and server are delivered in two own PLC applications in the form of TwinCAT 3 PLC project files. Before a PLC project can be imported into TwinCAT XAE, a TwinCAT 3 Solution must first be created. The PLC project can then be added to the solution via the command **Add Existing Item** in the context menu of the PLC node.

Project information

The default communication settings used in the above samples are as follows:

- PLC client application: Port and IP address of the remote server: 200, '127.0.0.1'
- PLC server application: Port and IP address of the local server: 200, '127.0.0.1'

To test the client and server application on two different PCs, you have to adjust the port and the IP address accordingly.

However, you can also test the client and server samples with the default values on a single computer by loading the client application into the first PLC runtime system and the server application into the second PLC runtime system.

The behavior of the PLC project sample is determined by the following global variables/constants.

Constant	Value	Description
PLCPRJ_MAX_CONNECTIONS	5	Max. number of server->client connections. A server can establish connections to more than one client. A client can establish a connection to only one server at a time.
PLCPRJ_SERVER_RESPONSE_TIMEOUT	T#10s	Max. delay time (timeout time) after which a server should send a response to the client.
PLCPRJ_CLIENT_SEND_CYCLE_TIME	T#1s	Cycle time based on which a client sends send data (TX) to the server.
PLCPRJ_RECEIVER_POLLING_CYCLE_TIME	T#200ms	Cycle time based on which a client or server polls for receive data (RX).
PLCPRJ_BUFFER_SIZE	10000	Max. internal buffer size for RX/TX data.

The PLC samples define and use the following internal error codes:

Error code	Value	Description
PLCPRJ_ERROR_RECEIVE_BUFFER_OVERFLOW	16#8101	The internal receive buffer reports an overflow.
PLCPRJ_ERROR_SEND_BUFFER_OVERFLOW	16#8102	The internal send buffer reports an overflow.
PLCPRJ_ERROR_RESPONSE_TIMEOUT	16#8103	The server has not sent the response within the specified timeout time.
PLCPRJ_ERROR_INVALID_FRAME_FORMAT	16#8104	The telegram formatting is incorrect (size, faulty data bytes etc.).

The client and server applications (FB_ServerApplication, FB_ClientApplication) were implemented as function blocks. The application and the connection can thus be instanced repeatedly.

6.1.5 Sample05: Binary data exchange

This sample is based on the functionality offered by the former TcSocketHelper.Lib, which is now part of Tc2_TcIp library. It realizes a Client/Server PLC application based on the functionality provided by the former SocketHelper library.

This sample offers a client-server application for the exchange of binary data. To achieve this, a simple sample protocol is implemented. The length of the binary data and a frame counter for the sent and received telegrams are transferred in the protocol header.

The structure of the binary data is defined by the PLC structure ST_ApplicationBinaryData. The binary data are appended to the headers and transferred. The instances of the binary structure are called toServer, fromServer on the client side and toClient, fromClient on the server side.

The structure declaration on the client and server sides can be adapted as required. The structure declaration must be identical on both sides.

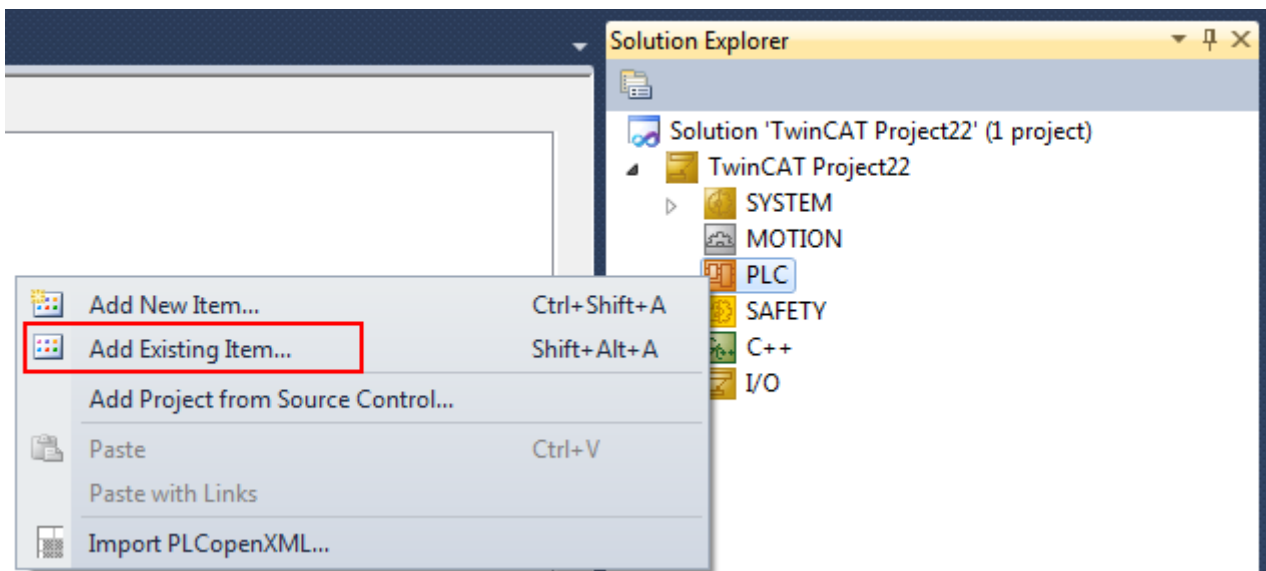

The maximum size of the structure must not exceed the maximum buffer size of the send/receive Fifos. The maximum buffer size is determined by a constant.

The server functionality is implemented in the function block FB_ServerApplication and the client functionality in the function block FB_ClientApplication.

In the standard implementation the client cyclically sends the data of the binary structure to the server and waits for a response from the server. The server modifies some data and returns them to the client.

If you require a functionality, you have to modify the function blocks FB_ServerApplication and FB_ClientApplication accordingly.

The difference between this sample and sample04 is that the server can establish up to 5 connections and the client application may have 5 client instances. Each instance establishes a connection to the server.

System requirements

- TwinCAT 3 Build 3093 or higher
- TwinCAT 3 Function TF6310 TCP/IP
- If two computers are used to execute the sample (one client and one server), the Function TF6310 needs to be installed on both computers
- If one computer is used to execute the sample, e.g. client and server running in two separate PLC runtimes, both PLC runtimes need to run in separate tasks.

Project downloads

The sample consists of two components (PLC client and PLC server), which can be downloaded in a .zip archive. Client and server are delivered in two own PLC applications in the form of TwinCAT 3 PLC project files. Before a PLC project can be imported into TwinCAT XAE, a TwinCAT 3 Solution must first be created. The PLC project can then be added to the solution via the command **Add Existing Item** in the context menu of the PLC node.

Download: [TcpIpServer_TCP_Sample05.zip](#)

Project information

The default communication settings used in the above samples are as follows:

- PLC client application: Port and IP address of the remote server: 200, '127.0.0.1'
- PLC server application: Port and IP address of the local server: 200, '127.0.0.1'

To test the client and server application on two different PCs, you have to adjust the port and the IP address accordingly.

However, you can also test the client and server samples with the default values on a single computer by loading the client application into the first PLC runtime system and the server application into the second PLC runtime system.

The behavior of the PLC project sample is determined by the following global variables/constants.

Constant	Value	Description
PLCPRJ_MAX_CONNECTIONS	5	Max. number of server->client connections. A server can establish connections to more than one client. A client can establish a connection to only one server at a time.
PLCPRJ_SERVER_RESPONSE_TIMEOUT	T#10s	Max. delay time (timeout time) after which a server should send a response to the client.
PLCPRJ_CLIENT_SEND_CYCLE_TIME	T#1s	Cycle time based on which a client sends send data (TX) to the server.
PLCPRJ_RECEIVER_POLLING_CYCLE_TIME	T#200ms	Cycle time based on which a client or server polls for receive data (RX).
PLCPRJ_BUFFER_SIZE	10000	Max. internal buffer size for RX/TX data.

The PLC samples define and use the following internal error codes:

Error code	Value	Description
PLCPRJ_ERROR_RECEIVE_BUFFER_OVERFLOW	16#8101	The internal receive buffer reports an overflow.
PLCPRJ_ERROR_SEND_BUFFER_OVERFLOW	16#8102	The internal send buffer reports an overflow.
PLCPRJ_ERROR_RESPONSE_TIMEOUT	16#8103	The server has not sent the response within the specified timeout time.
PLCPRJ_ERROR_INVALID_FRAME_FORMAT	16#8104	The telegram formatting is incorrect (size, faulty data bytes etc.).

The client and server applications (FB_ServerApplication, FB_ClientApplication) were implemented as function blocks. The application and the connection can thus be instanced repeatedly.

6.2 UDP

6.2.1 Sample01: Peer-to-peer communication

6.2.1.1 Overview

The following example demonstrates the implementation of a simple Peer-to-Peer application in the PLC and consists of two PLC projects (PeerA and PeerB) plus a .NET application which also acts as a separate peer. All peer applications send a test string to a remote peer and at the same time receive strings from a remote peer. The received strings are displayed in a message box on the monitor of the target computer. Feel free to use and customize this sample to your needs.

System requirements

- TwinCAT 3 Build 3093 or higher
- TwinCAT 3 Function TF6310 TCP/IP
- If two computers are used to execute the sample, the Function TF6310 needs to be installed on both computers
- If one computer is used to execute the sample, e.g. Peer A und Peer B running in two separate PLC runtimes, both PLC runtimes need to run in separate tasks
- To run the .NET sample client, only .NET Framework 4.0 is needed

Project downloads

The sources of the two PLC devices only differ in terms of different IP addresses of the remote communication partners. All samples can be downloaded as a single zip archive. Please note that the PLC samples are delivered as a TwinCAT 3 PLC project file, which means you need to create a new TwinCAT 3 solution before importing the samples in TwinCAT XAE by right-clicking on the PLC node and selecting **Add existing item**.

- Download: [TcpIpServer_UDP_Sample01.zip](#) (PLC projects, Peer A and B)
- Download: [.NET program](#) (see [.NET program](#) [▶ 85])

Project description

The following links provide documentation for each component. Additionally, an own article explains how to start the PLC samples with step-by-step instructions.

- [Integration in TwinCAT and Test](#) [▶ 80] (Starting the PLC samples)
- [PLC devices A and B](#) [▶ 81] (Peer-to-Peer PLC application)
- [.NET communication](#) [▶ 85] (.NET sample client)

Auxiliary functions in the PLC sample projects

In the PLC samples, several functions, constants and function blocks are used, which are briefly described below:

Fifo function block

```
FUNCTION_BLOCK FB_Fifo
VAR_INPUT
    new : ST_FifoEntry;
END_VAR
VAR_OUTPUT
    bOk : BOOL;
    old : ST_FifoEntry;
END_VAR
```

A simple Fifo function block. One instance of this block is used as "send Fifo", another one as "receive Fifo". The messages to be sent are stored in the send Fifo, the received messages are stored in the receive Fifo. The bOk output variable is set to FALSE if errors occurred during the last action (AddTail or RemoveHead) (Fifo empty or overfilled).

A Fifo entry consists of the following components:

```
TYPE ST_FifoEntry :
STRUCT
    sRemoteHost : STRING(15); (* Remote address. String containing an (Ipv4) Internet Protocol dotted address. *)
    nRemotePort : UDINT; (* Remote Internet Protocol (IP) port. *)
    msg : STRING; (* Udp packet data *)
END_STRUCT
END_TYPE
```

LogError function

```
FUNCTION LogError : DINT
```

The function writes a message with the error code into the log book of the operating system (Event Viewer). The global variable bLogDebugMessages must first be set to TRUE.

LogMessage function

```
FUNCTION LogMessage : DINT
```

The function writes a message into the log book of the operating system (Event Viewer) if a new socket was opened or closed. The global variable `bLogDebugMessages` must first be set to `TRUE`.

SCORE_CODE function

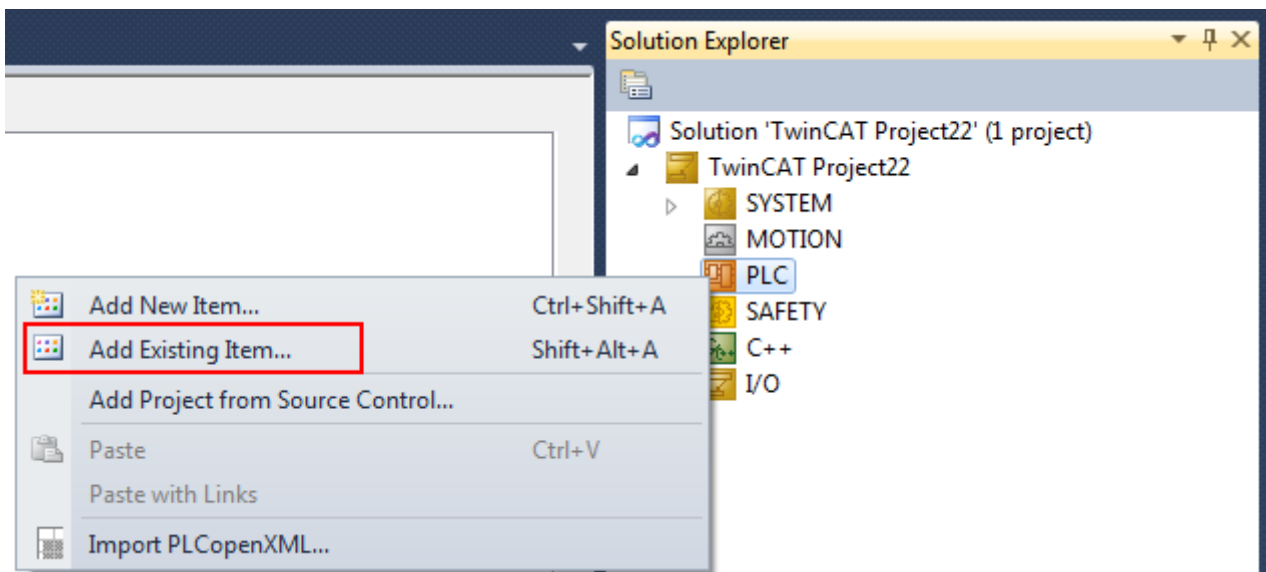

```
FUNCTION SCORE_CODE : DWORD
```

The function masks the lower 16 bits of a Win32 error code returns them.

6.2.1.2 Integration in TwinCAT and Test

The PLC samples are delivered as a TwinCAT 3 PLC project file. Therefore you need to create a new TwinCAT 3 solution before importing a sample. You can then import the PLC sample in TwinCAT XAE by right-clicking on the PLC node, selecting **Add existing item** and then navigating to the downloaded sample file (please choose *Plc 3.x Project archive (*.tzip)* as the file type).

Starting this sample requires two computers. Alternatively, the test may also be carried out with two runtime systems on a single computer. The constants with the port numbers and the IP addresses of the communication partners have to be modified accordingly.

Sample configuration with two computers:

- Device A is located on the local computer and has the IP address '10.1.128.21'
- Device B is located on the remote computer and has the IP address '172.16.6.195' 10.1.128.

Device A

Please perform the following steps to configure the sample on device A:

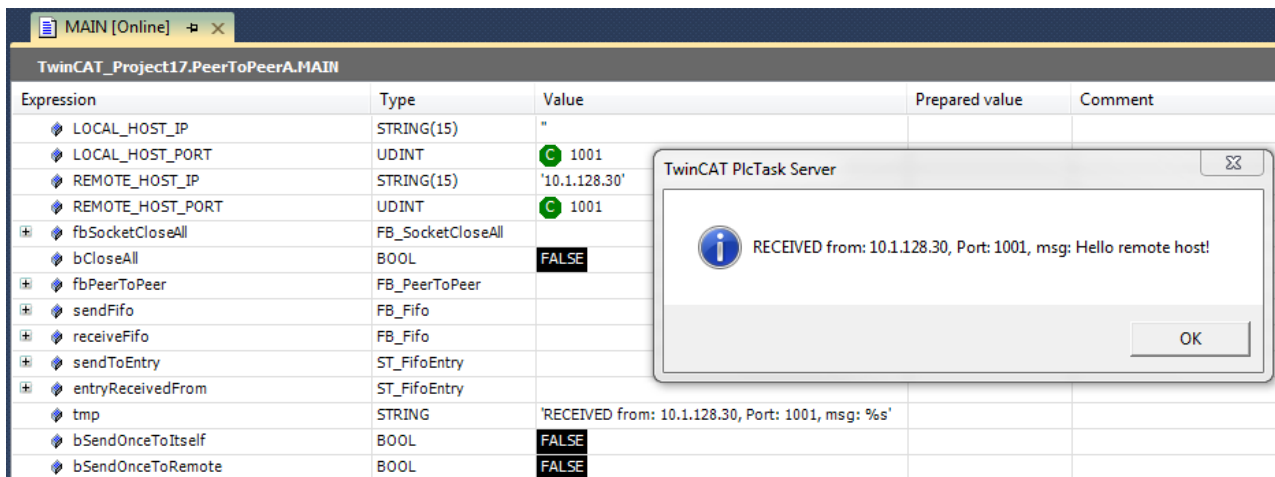

- Create a new TwinCAT 3 solution in TwinCAT XAE and import the Peer-to-Peer PLC project for device A.

- Set the constant REMOTE_HOST_IP in POU MAIN to the real IP address of the remote system (device B - in our example: '10.1.128.').
- Activate the configuration and start the PLC runtime. (Don't forget to create a license for TF6310 TCP/IP)

Device B

Please perform the following steps to configure the sample on device B:

- Create a new TwinCAT 3 solution in TwinCAT XAE and import the Peer-to-Peer PLC project for device B.
- Set the constant REMOTE_HOST_IP in POU MAIN to the IP address of device A (in our example: '10.1.128.21').
- Activate the configuration and start the PLC runtime. (Don't forget to create a license for TF6310 TCP/IP.)
- Login to the PLC runtime and write the value TRUE to the Boolean variable bSendOnceToRemote in POU MAIN.
- Shortly afterwards, a message box with the test string should appear on device A. You can now also repeat the same step on device A. As a result, the message box should then appear on device B.

6.2.1.3 PLC devices A and B

The required functionality was encapsulated in the function block FB_PeerToPeer. Each of the communication partners uses an instance of the FB_PeerToPeer function block. The block is activated through a rising edge at the bEnable input. A new UDP socket is opened, and data exchange commences. The socket address is specified via the variables sLocalHost and nLocalPort. A falling edge stops the data exchange and closes the socket. The data to be sent are transferred to the block through a reference (VAR_IN_OUT) via the variable sendFifo. The data received are stored in the variable receiveFifo.

Name	Default value	Description
g_sTclpConnSvrAddr	"	Network address of the TwinCAT TCP/IP Connection Server. Default: Empty string (the server is located on the local PC);
bLogDebugMessages	TRUE	Activates/deactivates writing of messages into the log book of the operating system;
PLCPRJ_ERROR_SENDFIFO_OV ERFLOW	16#8103	Sample project error code: The send Fifo is full.
PLCPRJ_ERROR_RECFFIFO_OVE RFLOW	16#8104	Sample project error code: The receive Fifo is full.

FUNCTION_BLOCK FB_PeerToPeer

Interface

```

VAR_IN_OUT
    sendFifo      : FB_Fifo;
    receiveFifo   : FB_Fifo;
END_VAR
VAR_INPUT
    sLocalHost    : STRING(15);
    nLocalPort    : UDINT;
    bEnable       : BOOL;
END_VAR
VAR_OUTPUT
    bCreated      : BOOL;
    bBusy         : BOOL;
    bError        : BOOL;
    nErrId        : UDINT;
END_VAR
VAR

MAIN program

Previously opened sockets must be closed after a program download or a PLC reset. During PLC start-up, this is done by calling an instance of the [FB SocketCloseAll](#) [► 23] function block. If one of the variables `bSendOnceToItself` or `bSendOnceToRemote` has a raising edge, a new Fifo entry is generated and stored in the send Fifo. Received messages are removed from the receive Fifo and displayed in a message box.

```

END_IF

```

6.2.1.4 .NET communication

This sample demonstrates how a .NET communication partner for PLC samples Peer-to-Peer device A or B can be realized.

The .NET Sample Client can be used to send single UDP data packages to a UDP Server, in this case the PLC project PeerToPeerA.

Download

[Download](#) the test client.

Unpack the ZIP file; the .exe file runs on a Windows system.

How it works

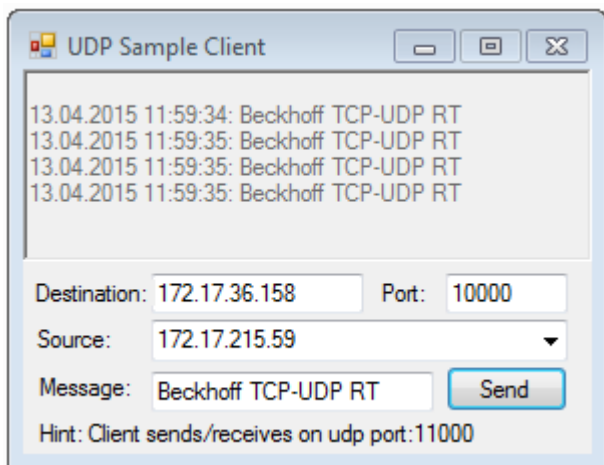

The sample uses the .Net libraries System.Net and System.Net.Sockets to implement a UDP client (class UdpClient). While listening for incoming UDP packets in a background thread, a string can be sent to a remote device by specifying its IP address and port number and clicking the Send button.

For a better understanding of this article, imagine the following setup:

- The PLC project Peer-to-Peer device A is running on a computer with IP address 10.1.128.21
- The .NET application is running on a computer with IP address 10.1.128.30

Description

The client itself uses port 11000 for sending. At the same time it opens this port and displays received messages in the upper part of the interface as a log:

Together with the PLC / C++ examples, this results in an echo example: A UDP message is sent from the client port 11000 to the server port 10000, which returns the same data to the sender.

The client can be configured via the interface:

- Destination: IP address
- Port: The port that is addressed in the destination
- Source: Sender network card (IP address).
"OS-based" operating system deals with selection of the appropriate network card.
- Message

TF6311 "TCP/UDP Realtime" does not allow local communication. However, for testing purposes a different network interface can be selected via "Source", so that the UDP packet leaves the computer through one network card and arrives on the other network card ("loop cable").

6.2.2 Sample02: Multicast

This sample demonstrates how to send and receive Multicast packages via UDP.

Client and Server cyclically send a value to each other via a Multicast IP address.

Client and Server are realized by two PLC applications and delivered within a single TwinCAT 3 solution.

System requirements

- TwinCAT 3 Build 3093 or higher
- TwinCAT 3 Function TF6310 TCP/IP version 1.0.64 or higher
- TwinCAT 3 Library Tc2_TcpIp version 3.2.64.0 or higher
- If one computer is used to execute the sample, e.g. client and server running in two separate PLC runtimes, both PLC runtimes need to run in separate tasks.

Project downloads

As mentioned, this sample consists of two components which can be downloaded as a TwinCAT 3 Solution in a single zip archive.

7 Appendix

7.1 OSI model

The following article is a short introduction into the OSI model and describes how this model takes part in our everyday network communication. Note that the ambition to create this article was not to replace more detailed documentations or books about this topic, therefore please only consider it to be a very superficial introduction.

The OSI (Open Systems Interconnection) model describes a standardization of the functionalities in a communication system via abstract layers. Each layer defines an own set of functionalities during the communication between network devices and only communicates with the layer above and below.

OSI model		
Layer	Name	Example protocols
7	Application Layer	HTTP, FTP, DNS, SNMP, Telnet
6	Presentation Layer	SSL, TLS
5	Session Layer	NetBIOS, PPTP
4	Transport Layer	TCP, UDP
3	Network Layer	IP, ARP, ICMP, IPSec
2	Data Link Layer	PPP, ATM, Ethernet
1	Physical Layer	Ethernet, USB, Bluetooth, IEEE802.11

Example: If you use your web browser to navigate to <http://www.beckhoff.com>, this communication uses the following protocols from each layer, starting at layer 7: HTTP → TCP → IP → Ethernet. On the other hand, entering <https://www.beckhoff.com> would use HTTP → SSL → TCP → IP → Ethernet.

The TwinCAT 3 Function TF6310 TCP/IP provides functionalities to develop network-enabled PLC programs using either the transport protocols TCP or UDP. Therefore, PLC programmers may implement their own application layer protocol, defining an own message structure to communicate with remote systems.

7.2 KeepAlive configuration

The transmission of TCP KeepAlive messages verifies if an idle TCP connection is still active. Since version 1.0.47 of the TwinCAT TCP/IP Server (TF6310), the KeepAlive configuration of the Windows operating system is used, which can be configured via the following registry keys:

The following documentation is an excerpt of a [Microsoft Technet](#) article.

KeepAliveTime

HKLM\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters

Data type	Range	Default value
REG_DWORD	0x1–0xFFFFFFFF (<i>milliseconds</i>)	0x6DDD00 (<i>7,200,000 milliseconds = 2 hours</i>)

Description

Determines how often TCP sends keep-alive transmissions. TCP sends keep-alive transmissions to verify that an idle connection is still active. This entry is used when the remote system is responding to TCP. Otherwise, the interval between transmissions is determined by the value of the [KeepAliveInterval](#) entry. By default, keep-alive transmissions are not sent. The TCP keep-alive feature must be enabled by a program, such as Telnet, or by an Internet browser, such as Internet Explorer.

KeepAliveInterval

HKLM\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters

Data type	Range	Default value
REG_DWORD	0x1–0xFFFFFFFF (<i>milliseconds</i>)	0x3E8 (<i>1,000 milliseconds = 1 second</i>)

Description

Determines how often TCP repeats keep-alive transmissions when no response is received. TCP sends keep-alive transmissions to verify that idle connections are still active. This prevents TCP from inadvertently disconnecting active lines.

7.3 Error codes

7.3.1 Overview of the error codes

Codes (hex)	Codes (dec)	Error source	Description
0x00000000-0x00007800	0-30720	TwinCAT system error codes	TwinCAT system error (including ADS error codes)
0x00008000-0x000080FF	32768-33023	Internal TwinCAT TCP/IP Connection Server error codes [▶ 89]	Internal error of the TwinCAT TCP/IP Connection Server
0x80070000-0x8007FFFF	2147942400-2148007935	Error source = Code - 0x80070000 = Win32 system error codes	Win32 system error (including Windows sockets error codes)

Requirements

Development environment	Target system type	PLC libraries to include
TwinCAT v3.1	PC, CX (x86) or CX (ARM)	Tc2_Tcplp

7.3.2 Internal error codes of the TwinCAT TCP/IP Connection Server

Code (hex)	Code (dec)	Symbolic constant	Description
0x00008001	32769	TCPADSError_NO_MORE_REENTRIES	No new sockets can be created (for FB_SocketListen and FB_SocketConnect).
0x00008002	32770	TCPADSError_INVALID_HANDLE	Socket handle is invalid (for FB_SocketReceive, FB_SocketAccept, FB_SocketSend etc.).
0x00008003	32771	TCPADSError_ALREADY_EXISTS	Is returned when FB_SocketListen is called, if the Tcplp port listener already exists.
0x00008004	32772	TCPADSError_NOT_CONNECTED	Is returned when FB_SocketReceive is called, if the client socket is no longer connected with the server.
0x00008005	32773	TCPADSError_LISTENING_ERROR	Is returned when FB_SocketAccept is called, if an error was registered in the listener socket.

Requirements

Development environment	Target system type	PLC libraries to include
TwinCAT v3.1	PC, CX (x86) or CX (ARM)	Tc2_Tcplp

7.3.3 Troubleshooting/diagnostics

- In the event of connection problems the PING command can be used to ascertain whether the external communication partner can be reached via the network connection. If this is not the case, check the network configuration and firewall settings.
- Sniffer tools such as Wireshark enable logging of the entire network communication. The log can then be analysed by Beckhoff support staff.
- Check the hardware and software requirements described in this documentation (TwinCAT version, CE image version etc.).
- Check the software installation hints described in this documentation (e.g. installation of CAB files on CE platform).
- Check the input parameters that are transferred to the function blocks (network address, port number, data etc, connection handle.) for correctness. Check whether the function block issues an error code. The documentation for the error codes can be found here: [Overview of error codes \[► 88\]](#).
- Check if the other communication partner/software/device issues an error code.
- Activate the debug output integrated in the TcSocketHelper.Lib during connection establishment/disconnect process (keyword: CONNECT_MODE_ENABLEDBG). Open the TwinCAT System Manager and activate the LogView window. Analyze/check the debug output strings.

Requirements

Development environment	Target system type	PLC libraries to include
TwinCAT v3.1	PC, CX (x86) or CX (ARM)	Tc2_Tcplp

7.4 Support and Service

Beckhoff and their partners around the world offer comprehensive support and service, making available fast and competent assistance with all questions related to Beckhoff products and system solutions.

Beckhoff's branch offices and representatives

Please contact your Beckhoff branch office or representative for local support and service on Beckhoff products!

The addresses of Beckhoff's branch offices and representatives round the world can be found on her internet pages:

<http://www.beckhoff.com>

You will also find further documentation for Beckhoff components there.

Beckhoff Headquarters

Beckhoff Automation GmbH & Co. KG

Huelshorstweg 20
33415 Verl
Germany

Phone:	+49(0)5246/963-0
Fax:	+49(0)5246/963-198
e-mail:	info@beckhoff.com

Beckhoff Support

Support offers you comprehensive technical assistance, helping you not only with the application of individual Beckhoff products, but also with other, wide-ranging services:

- support
- design, programming and commissioning of complex automation systems
- and extensive training program for Beckhoff system components

Hotline:	+49(0)5246/963-157
Fax:	+49(0)5246/963-9157
e-mail:	support@beckhoff.com

Beckhoff Service

The Beckhoff Service Center supports you in all matters of after-sales service:

- on-site service
- repair service
- spare parts service
- hotline service

Hotline:	+49(0)5246/963-460
Fax:	+49(0)5246/963-479
e-mail:	service@beckhoff.com
