1 Foreword

1.1 Notes on the documentation

This description is only intended for the use of trained specialists in control and automation engineering who are familiar with the applicable national standards.

It is essential that the documentation and the following notes and explanations are followed when installing and commissioning the components.

It is the duty of the technical personnel to use the documentation published at the respective time of each installation and commissioning.

The responsible staff must ensure that the application or use of the products described satisfy all the requirements for safety, including all the relevant laws, regulations, guidelines and standards.

Disclaimer

The documentation has been prepared with care. The products described are, however, constantly under development.

We reserve the right to revise and change the documentation at any time and without prior announcement. No claims for the modification of products that have already been supplied may be made on the basis of the data, diagrams and descriptions in this documentation.

1.2 Safety instructions

Safety regulations

Please note the following safety instructions and explanations!
Product-specific safety instructions can be found on following pages or in the areas mounting, wiring, commissioning etc.

Exclusion of liability

All the components are supplied in particular hardware and software configurations appropriate for the application. Modifications to hardware or software configurations other than those described in the documentation are not permitted, and nullify the liability of Beckhoff Automation GmbH & Co. KG.

Personnel qualification

This description is only intended for trained specialists in control, automation and drive engineering who are familiar with the applicable national standards.

Description of symbols

In this documentation the following symbols are used with an accompanying safety instruction or note. The safety instructions must be read carefully and followed without fail!

DANGER

Serious risk of injury!

Failure to follow the safety instructions associated with this symbol directly endangers the life and health of persons.

WARNING

Risk of injury!

Failure to follow the safety instructions associated with this symbol endangers the life and health of persons.

CAUTION

Personal injuries!

Failure to follow the safety instructions associated with this symbol can lead to injuries to persons.

NOTE

Damage to the environment or devices

Failure to follow the instructions associated with this symbol can lead to damage to the environment or equipment.

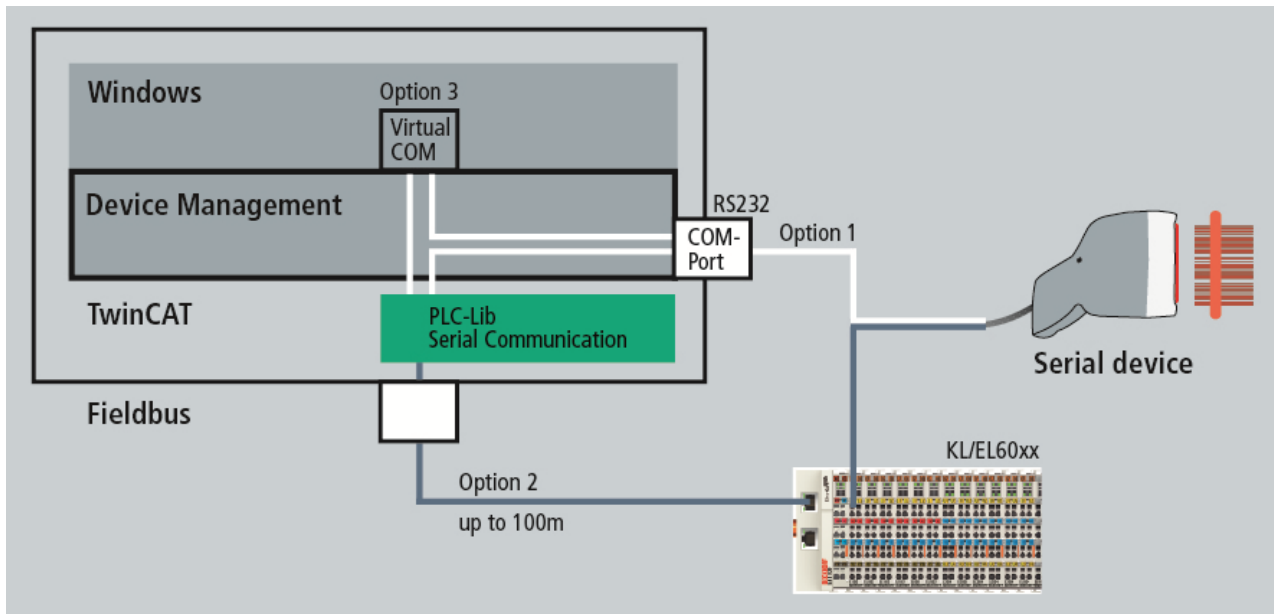

Tip or pointer

This symbol indicates information that contributes to better understanding.

2 Overview

The TwinCAT 3 function enables serial data communication for the TwinCAT 3 PLC.

The following three options are available for the communication:

Option 1: PC COM ports

You can address your physical COM port directly from the PLC.

Option 2: Beckhoff terminals

The network-based fieldbus system from Beckhoff can be used to access serial terminals at a distance of up to 100 m.

The following Beckhoff terminals are supported:

- KL6xxx Bus Terminals
- EL60xx EtherCAT Terminals

Option 3: Virtual COM ports

The function provides an ADS server for accessing virtual COM ports of the operating system from the PLC. This makes it possible to use USB devices that come with a proprietary USB-to-VirtualCom driver. The COM port must register in Windows as 'COM1' ... 'COM255'.

i Installation required

To use virtual COM ports, it is necessary to install the TC3 Function Setups on the system in which the virtual COM port exists.

Components of the TwinCAT 3 function:

- **PLC library Tc2_SerialCom:** The PLC library provides function blocks and data structures for communicating with serial devices. Various function blocks for sending, receiving and configuration are available. All function blocks support multiple instances, so that, depending on the processing capacity of the PC, any number of serial interfaces can be operated in parallel. In addition to the basic send and receive functions for transparent data, the **3964R protocol** is supported. A fail-safe protocol for transmitting any data is implemented. A checksum in combination with repetition of faulty telegrams provide the error protection. The **RK512 protocol** is used to transmit data blocks such as are used in Siemens controllers. The user

only has to parameterize the RK512 function block. It uses the 3964R protocol and handles the necessary telegram traffic. It supports the transmission of data blocks with a length of up to 128 data words.

- **TwinCAT TcAdsSerialCommServer:** The service is started and stopped together with TwinCAT. It is used to communicate with virtual COM ports of the operating system. Otherwise, this component can be omitted during installation.

3 Installation

3.1 System Requirements

Technical data	TF6340 TC3 Serial Communication
Target System	WinXP, WES, Win7, WES7, WEC7, Win10 IPC or CX, (x86, x64, ARM)
Min. TwinCAT version	3.1.4000
Min. TwinCAT level	TC1200 TC3 PLC

Special system requirements

The installation of the TF6340 TC3 Serial Communication product offers the option to install an ADS server. This is necessary if virtual COM ports are to be accessed.

When using the TcAdsSerialCommServer, the following system requirements apply for the system on which the ADS server is to be installed:

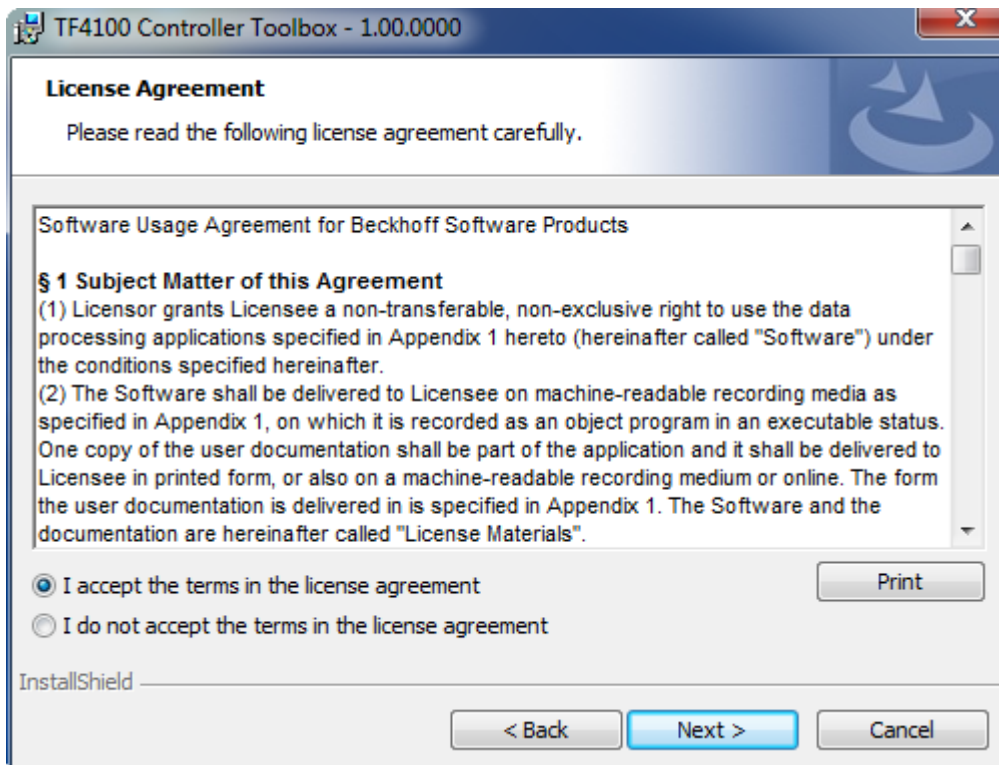

Technical data	TF6340 TC3 Serial Communication
Target System	WinXP, WES, Win7, WES7, WEC7, Win10 IPC or CX (x86, x64, ARM)
Min. Target Platform Level	P 30 or higher
Min. TwinCAT version	3.1.4000
Min. TwinCAT level	TC1000 TC3 ADS

3.2 Installation

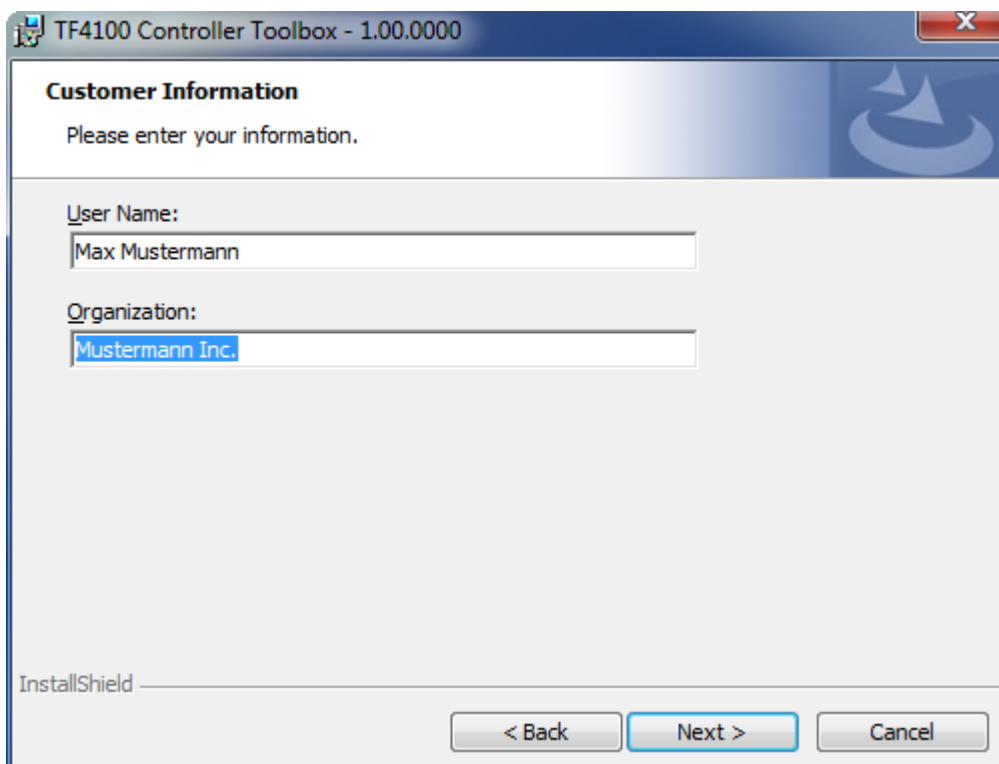

The following section describes how to install the TwinCAT 3 Function for Windows-based operating systems.

- ✓ The TwinCAT 3 Function setup file was downloaded from the Beckhoff website.
- 1. Run the setup file as administrator. To do this, select the command **Run as administrator** in the context menu of the file.
 - ⇒ The installation dialog opens.

2. Accept the end user licensing agreement and click **Next**.

3. Enter your user data.

- If you want to install the full version of the TwinCAT 3 Function, select **Complete** as installation type. If you want to install the TwinCAT 3 Function components separately, select **Custom**.

- Select **Next**, then **Install** to start the installation.

⇒ A dialog box informs you that the TwinCAT system must be stopped to proceed with the installation.

6. Confirm the dialog with **Yes**.

7. Select **Finish** to exit the setup.

⇒ The TwinCAT 3 Function has been successfully installed and can be licensed (see [Licensing](#) [▶ 14]).

3.3 Installation Windows CE

The following section describes how to install a TwinCAT 3 function (TFxxx) on a Beckhoff Embedded PC with Windows CE.

1. [Download and install the setup file](#) [▶ 12]
2. [Transfer the CAB file to the Windows CE device](#) [▶ 13]
3. [Run the CAB file on the Windows CE device](#) [▶ 13]

If an older TFxxx version is already installed on the Windows CE device, it can be updated:

- [Software upgrade](#) [▶ 13]

Download and install the setup file

The CAB installation file for Windows CE is part of the TFxxx setup. This is made available on the Beckhoff website www.beckhoff.com and automatically contains all versions for Windows XP, Windows 7 and Windows CE (x86 and ARM).

Download the TFxxx setup file and install the TwinCAT 3 function as described in the [Installation \[▶ 9\]](#) section.

After the installation, the installation folder contains three directories (one directory per hardware platform):

- **CE-ARM:** ARM-based Embedded PCs running Windows CE, e.g. CX8090, CX9020
- **CE-X86:** X86-based Embedded PCs running Windows CE, e.g. CX50xx, CX20x0
- **Win32:** Embedded PCs running Windows XP, Windows 7 or Windows Embedded Standard

The CE-ARM and CE-X86 directories contain the CAB files of the TwinCAT 3 function for Windows CE in relation to the respective hardware platform of the Windows CE device.

Example: "TF6310" installation folder

Transfer the CAB file to the Windows CE device

Transfer the corresponding CAB file to the Windows CE device.

There are various options for transferring the executable file:

- via network shares
- via the integrated FTP server
- via ActiveSync
- via CF/SD cards

Further information can be found in the Beckhoff Information System in the "Operating Systems" documentation (Embedded PC > Operating Systems > [CE](#)).

Run the CAB file on the Windows CE device

After transferring the CAB file to the Windows CE device, double-click the file there. Confirm the installation dialog with **OK**. Then restart the Windows CE device.

After restarting the device, the files of the TwinCAT 3 function (TFxxxx) are automatically loaded in the background and are then available.

The software is installed in the following directory on the Windows CE device:

`\Hard Disk\TwinCAT\Functions\TFxxxx`

Software upgrade

If an older version of the TwinCAT 3 function is already installed on the Windows CE device, carry out the following steps on the Windows CE device to upgrade to a new version:

1. Open the CE Explorer by clicking **Start > Run** and entering "Explorer".
2. Navigate to `\Hard Disk\TwinCAT\Functions\TFxxx\lxxx`.
3. Rename the file `Tc*.exe` to `Tc*.old`.

4. Restart the Windows CE device.
 5. Transfer the new CAB file to the Windows CE device.
 6. Run the CAB file on the Windows CE device and install the new version.
 7. Delete the file *Tc*.old*.
 8. Restart the Windows CE device.
- ⇒ The new version is active after the restart.

3.4 Licensing

The TwinCAT 3 Function can be activated as a full version or as a 7-day test version. Both license types can be activated via the TwinCAT 3 development environment (XAE).

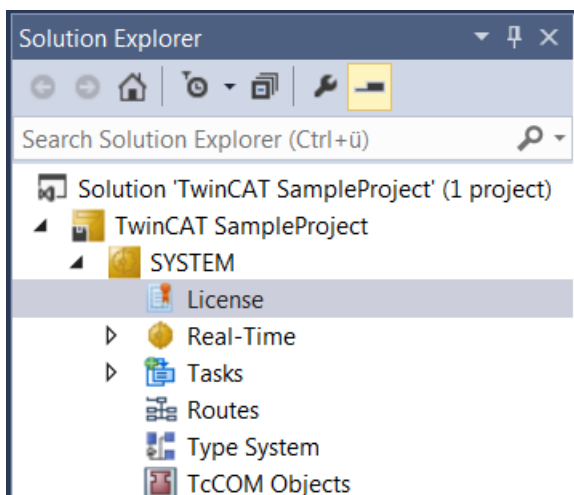

The licensing of a TwinCAT 3 Function is described below. The description is divided into the following sections:

- [Licensing a 7-day test version \[► 14\]](#)
- [Licensing a full version \[► 16\]](#)

Further information on TwinCAT 3 licensing can be found in the “Licensing” documentation in the Beckhoff Information System (TwinCAT 3 > [Licensing](#)).

Licensing a 7-day test version

1. Start the TwinCAT 3 development environment (XAE).
2. Open an existing TwinCAT 3 project or create a new project.
3. If you want to activate the license for a remote device, set the desired target system. To do this, select the target system from the **Choose Target System** drop-down list in the toolbar.
 - ⇒ The licensing settings always refer to the selected target system. When the project is activated on the target system, the corresponding TwinCAT 3 licenses are automatically copied to this system.
4. In the **Solution Explorer**, double-click **License** in the **SYSTEM** subtree.

⇒ The TwinCAT 3 license manager opens.

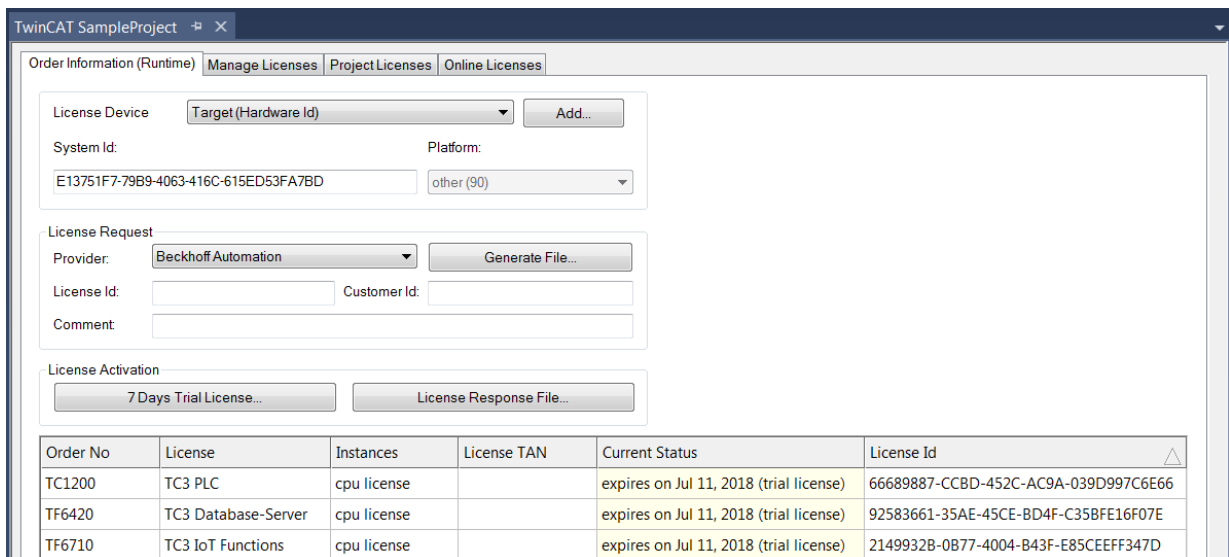

- Open the **Manage Licenses** tab. In the **Add License** column, check the check box for the license you want to add to your project (e.g. "TF6420: TC3 Database Server").

- Open the **Order Information (Runtime)** tab.
 - ⇒ In the tabular overview of licenses, the previously selected license is displayed with the status "missing".

- Click **7-Day Trial License...** to activate the 7-day trial license.

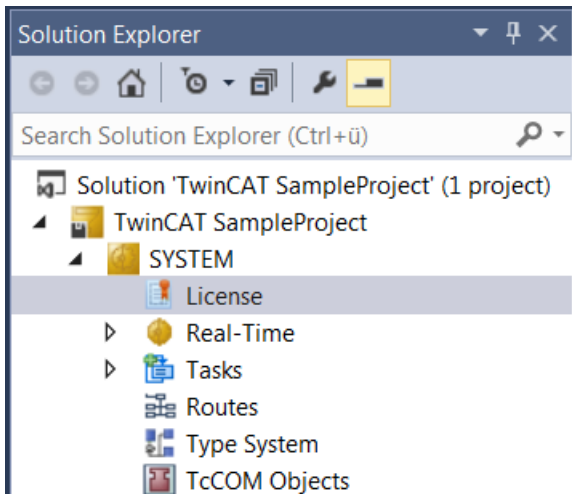

⇒ A dialog box opens, prompting you to enter the security code displayed in the dialog.

- Enter the code exactly as it appears, confirm it and acknowledge the subsequent dialog indicating successful activation.
 - ⇒ In the tabular overview of licenses, the license status now indicates the expiration date of the license.
- Restart the TwinCAT system.

⇒ The 7-day trial version is enabled.

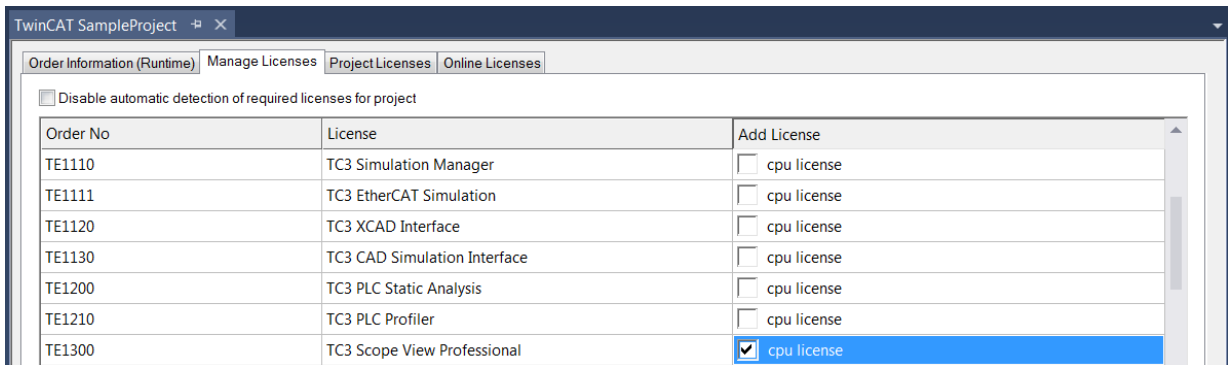

Licensing a full version

1. Start the TwinCAT 3 development environment (XAE).
2. Open an existing TwinCAT 3 project or create a new project.
3. If you want to activate the license for a remote device, set the desired target system. To do this, select the target system from the **Choose Target System** drop-down list in the toolbar.
 - ⇒ The licensing settings always refer to the selected target system. When the project is activated on the target system, the corresponding TwinCAT 3 licenses are automatically copied to this system.
4. In the **Solution Explorer**, double-click **License** in the **SYSTEM** subtree.

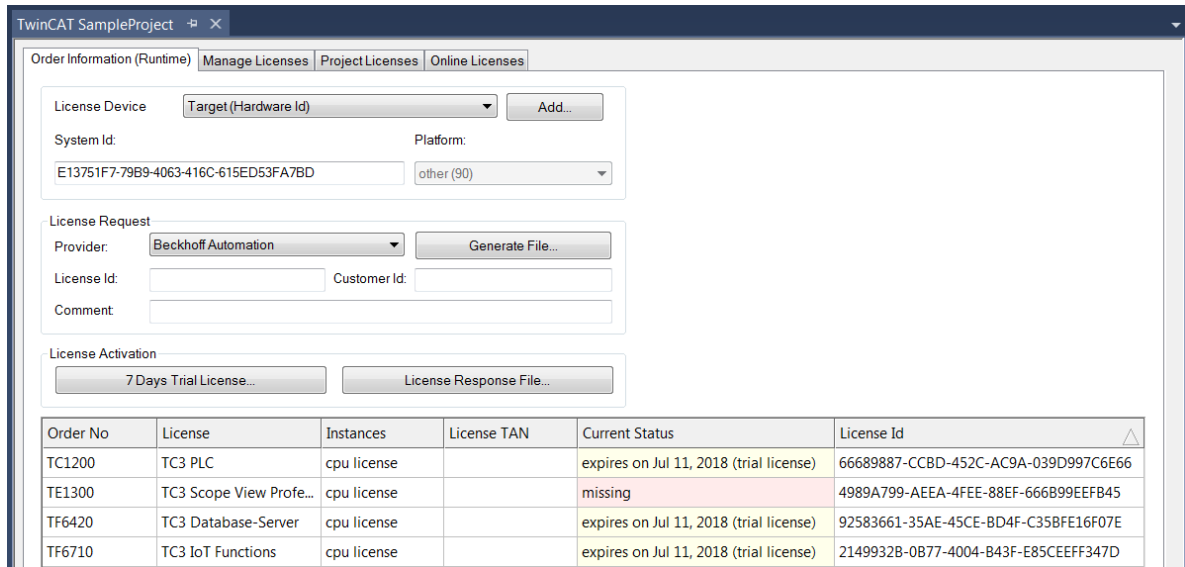

⇒ The TwinCAT 3 license manager opens.

5. Open the **Manage Licenses** tab. In the **Add License** column, check the check box for the license you want to add to your project (e.g. "TE1300: TC3 Scope View Professional").

6. Open the **Order Information** tab.

⇒ In the tabular overview of licenses, the previously selected license is displayed with the status “missing”.

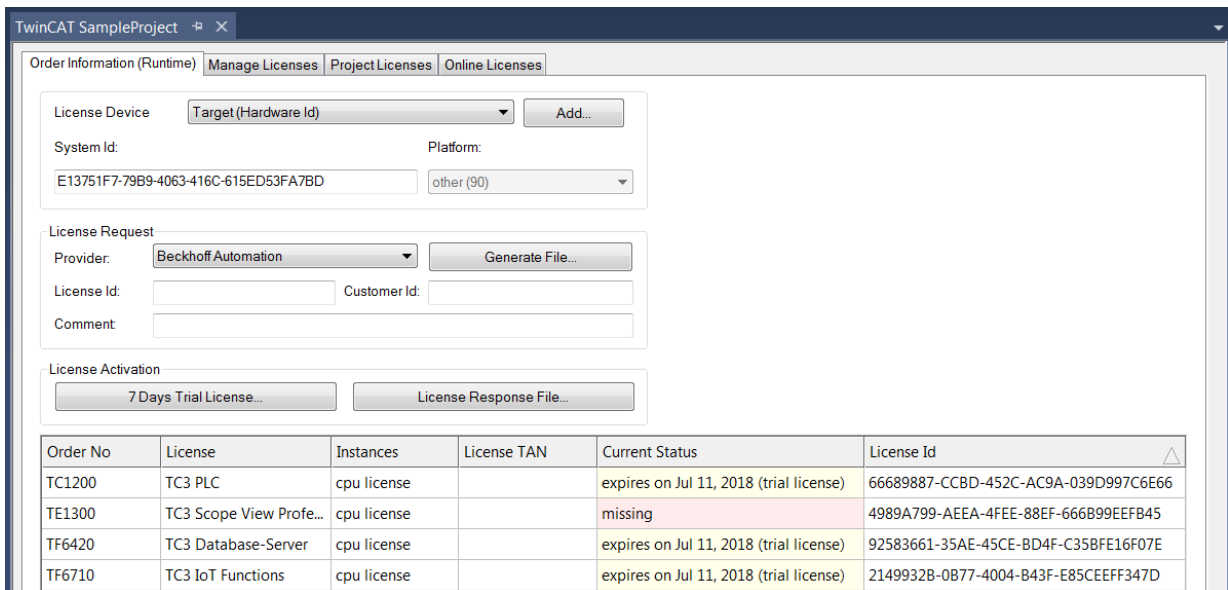

A TwinCAT 3 license is generally linked to two indices describing the platform to be licensed:

System ID: Uniquely identifies the device

Platform level: Defines the performance of the device

The corresponding **System Id** and **Platform** fields cannot be changed.

7. Enter the order number (**License Id**) for the license to be activated and optionally a separate order number (**Customer Id**), plus an optional comment for your own purposes (**Comment**). If you do not know your Beckhoff order number, please contact your Beckhoff sales contact.

8. Click the **Generate File...** button to create a License Request File for the listed missing license.
 - ⇒ A window opens, in which you can specify where the License Request File is to be stored. (We recommend accepting the default settings.)
9. Select a location and click **Save**.

- ⇒ A prompt appears asking whether you want to send the License Request File to the Beckhoff license server for verification:

- Click **Yes** to send the License Request File. A prerequisite is that an email program is installed on your computer and that your computer is connected to the internet. When you click **Yes**, the system automatically generates a draft email containing the License Request File with all the necessary information.
- Click **No** if your computer does not have an email program installed on it or is not connected to the internet. Copy the License Request File onto a data storage device (e.g. a USB stick) and send the file from a computer with internet access and an email program to the Beckhoff license server (tcllicense@beckhoff.com) by email.

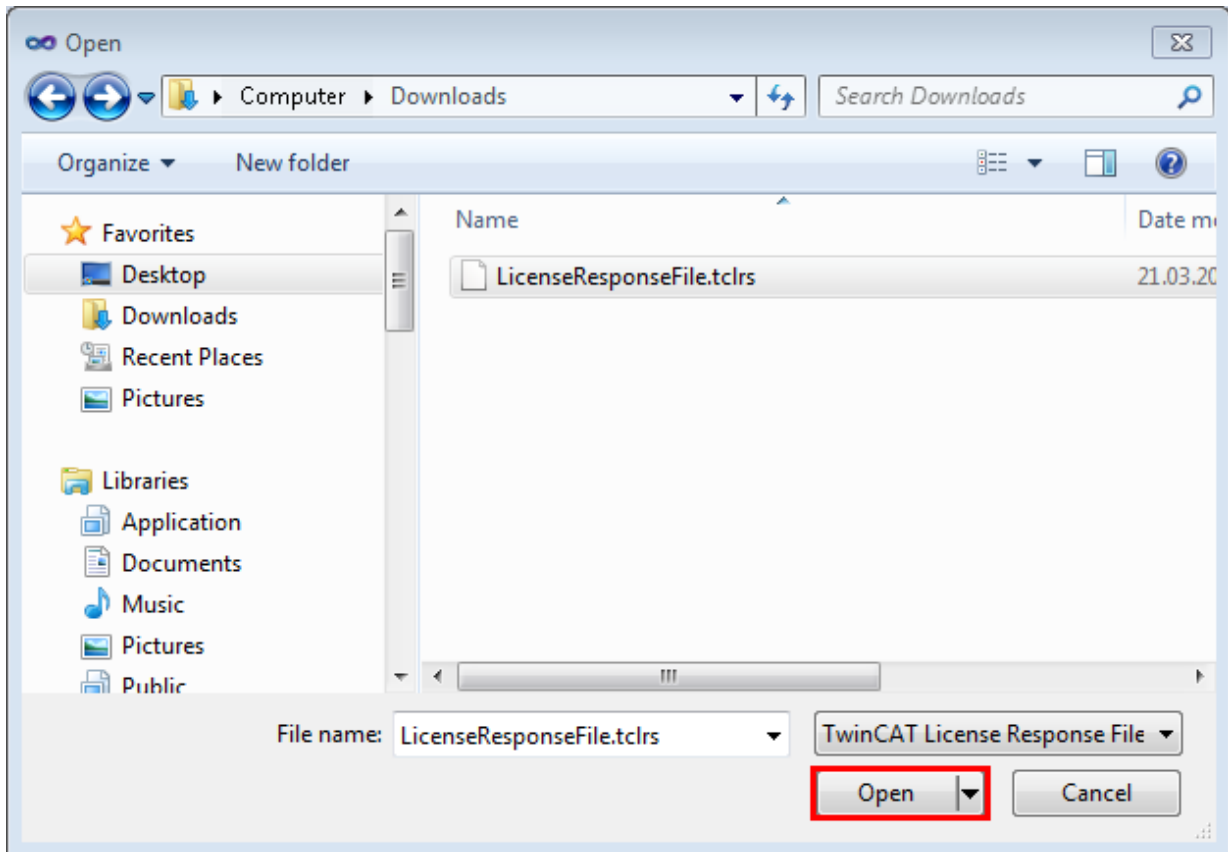

10. Send the License Request File.

- ⇒ The License Request File is sent to the Beckhoff license server. After receiving the email, the server compares your license request with the specified order number and returns a License Response File by email. The Beckhoff license server returns the License Response File to the same email address from which the License Request File was sent. The License Response File differs from the License Request File only by a signature that documents the validity of the license file content. You can view the contents of the License Response File with an editor suitable for XML files (e.g. "XML Notepad"). The contents of the License Response File must not be changed, otherwise the license file becomes invalid.

11. Save the License Response File.

12. To import the license file and activate the license, click **License Response File...** in the **Order Information** tab.

13. Select the License Response File in your file directory and confirm the dialog.

⇒ The License Response File is imported and the license it contains is activated.
Existing demo licenses will be removed.

14. Restart the TwinCAT system.

⇒ The license becomes active when TwinCAT is restarted. The product can be used as a full version.
During the TwinCAT restart the license file is automatically copied to the directory `...\\TwinCAT\\3.1\\Target\\License` on the respective target system.

4 Configuration

4.1 Tutorial

This tutorial guides the user through the complete implementation of a serial communication. The following tasks are explained step by step:

- Adding the required PLC library
- Configuring the PLC background communication to ensure the data exchange with the process image
- Implementation of a small PLC application that sends and receives data
- Task configuration
- Adding the hardware component and linking with the PLC process image

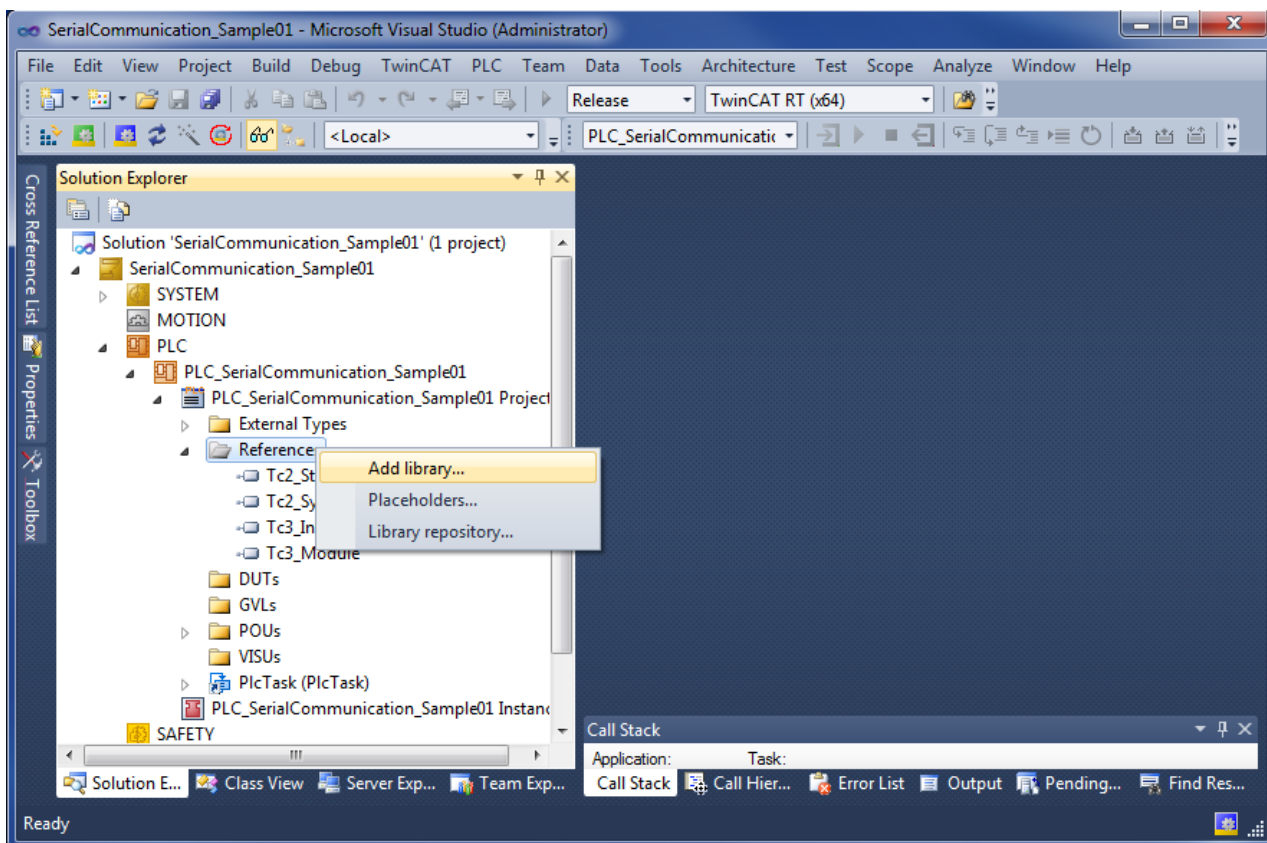

The tutorial is suitable for all hardware interfaces: Pc COM port, EL6xxx or KL6xxx terminal.

Further examples and a download option for the TwinCAT project described here can be found in [section Examples \[▶ 66\]](#).

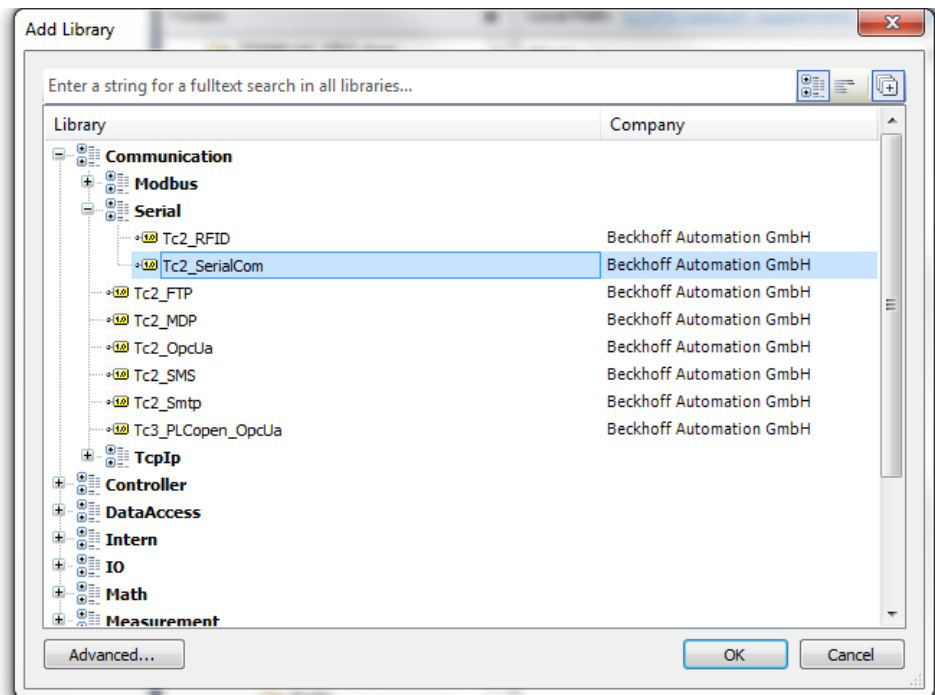

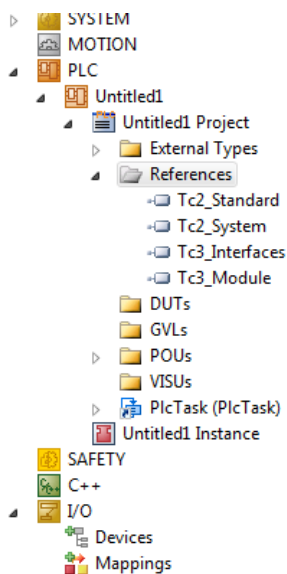

4.1.1 Add library to PLC project

Create a new PLC project to start integration of the library for the demo implementation.

In your PLC project select "**Add Library**" from the References node.

Navigate to the category Communication/Serial and select the library Tc2_SerialCom:

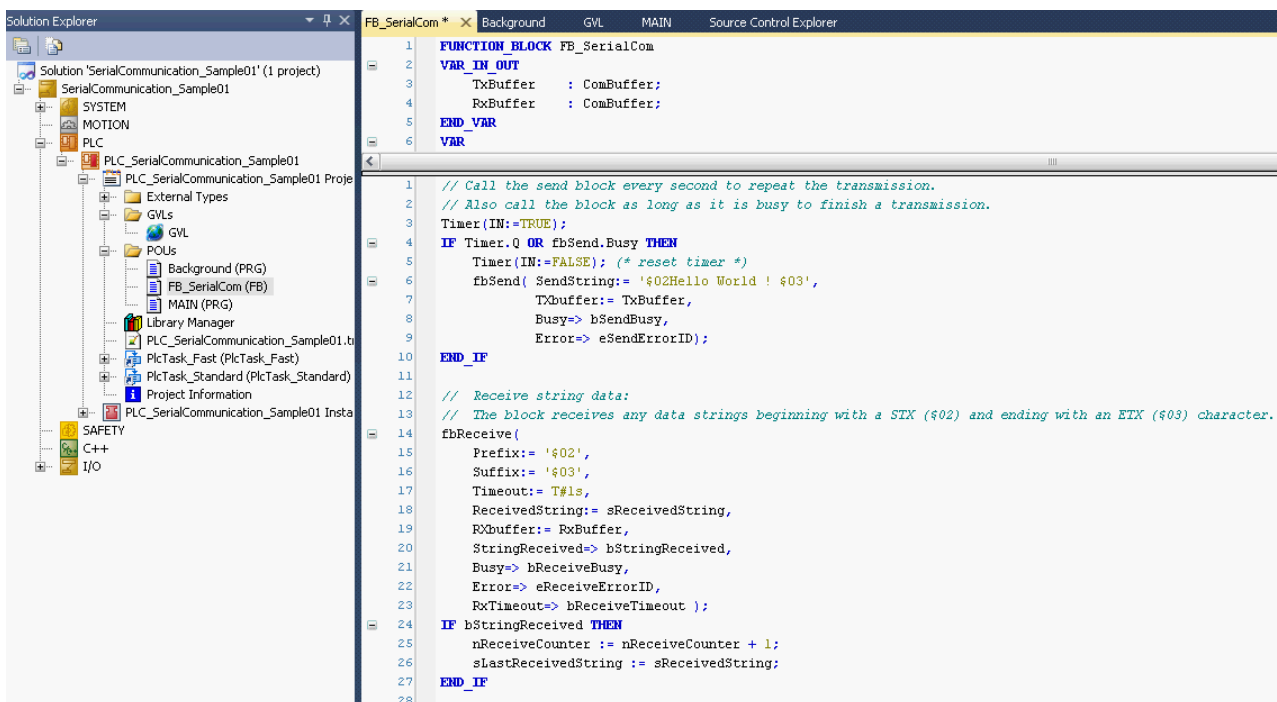

4.1.2 Sending and Receiving

Data is sent and received from the standard task.

The example program included sends data by way of different serial hardware interfaces. At the same time data with correct prefix and suffix is received.

If a loop back adapter is connected to the serial hardware interfaces, the sent characters are received again and again.

Many other use cases exist. For example data can be sent by way of the serial PC interface to a printer. Or a bar code from a scanner that is connected to a serial bus terminal can be received.

Possible errors

More than one character may be transmitted during one PLC cycle, provided they can be accepted by the send buffer. If the send buffer overflows, the busy output of the send block will remain TRUE after it has been called. In that case the last character is not sent, and the block must be called again with the same input data in the next PLC cycle. How full a buffer is can be determined at any time (e.g. TxBuffer.Count or TxBuffer.FreeByte).

4.1.3 Background Communication

Communication between the serial hardware and the data buffer, whose type is [ComBuffer \[► 57\]](#), is handled in the standard task or in a separate fast task depending on the hardware specifications.

A fast separate task will be necessary at high baud rates or with KL6001 terminals which have a small process image (3 or 5 data bytes only). See also the [Communication Principle \[► 33\]](#).

The tutorial uses the following three hardware interfaces:

hardware interface	background communication
Pc COM port	in standard task
EL6001	in seperate fast task
KL6001 (3 bytes)	in seperate fast task

data strutures

Four data structures are needed to access a serial interface.

We distinguish between two different kinds of data structures:

- Hardware dependent structures provide the connection to the hardware in the send and receive directions.
- Two data buffers are also necessary for intermediate storage.

Pc COM Port:

```
PROGRAM MAIN
VAR
  (* I/O variables for a PC-COM port *)
  stIn_PcCom AT %I* : PcComInData; (* linked to the port in the TwinCAT System Manager *)
  stOut_PcCom AT %Q* : PcComOutData; (* linked to the port in the TwinCAT System Manager *)
  RxBufferPcCom : ComBuffer; (* Receive data buffer; used with all receive function blocks *)
  TxBufferPcCom : ComBuffer; (* Transmit data buffer; used with all receive function blocks *)
END_VAR
```

EL6xxx und KL6xxx:

```
VAR_GLOBAL
  RxBufferEL : ComBuffer; (* Receive data buffer; used with all receive function blocks *)
  TxBufferEL : ComBuffer; (* Transmit data buffer; used with all receive function blocks *)

  RxBufferKL : ComBuffer; (* Receive data buffer; used with all receive function blocks *)
  TxBufferKL : ComBuffer; (* Transmit data buffer; used with all receive function blocks *)
END_VAR

PROGRAM Background

  stOut_KL6001 AT %Q* : KL6outData; (* linked to the KL6001 in the TwinCAT System Manager *)
END_VAR
```

SerialLineControl

The SerialLineControl function block must be called in each PLC cycle. It communicates with the serial hardware device and sends and receives data. The block can be called from the standard task or the separate fast task.

Called from the standard task, Pc COM port:

```

PROGRAM MAIN
VAR
  (* background communication with the PC COM port device *)
  fbPcComCtrl      : SerialLineControl;
  bPcComCtrlError  : BOOL;
  ePcComCtrlErrorID : ComError_t;
END_VAR

(* background communication with the PC COM port device *)
fbPcComCtrl(

  Error     => bPcComCtrlError,
  ErrorID   => ePcComCtrlErrorID,
  TxBuffer  := TxBufferPcCom,
  RxBuffer  := RxBufferPcCom );

```

Called from the separate fast task, EL6xxx and KL6xxx:

```

    ErrorID=> eKL6001CtrlErrorID,
    TxBuffer:= TxBufferKL,
    RxBuffer:= RxBufferKL );
END_IF

```

4.1.4 Task Configuration

The speed of the serial interfaces must be considered for the task configuration (see the section on [Supported Hardware](#) [► 31] and the [Communication Principle](#) [► 33]).

For example, in order that, with 9600 bauds at the serial bus terminal, the data can all actually be processed at this speed, the associated communication block must be active at least once per millisecond. The task that operates the block must have a correspondingly fast setting. The simplest case is when the entire PLC program runs in this fast task. If the task is set slower, then as long as the interface operates with a hardware handshake, the communication will function at reduced speed. Without handshake, data to be received can be lost.

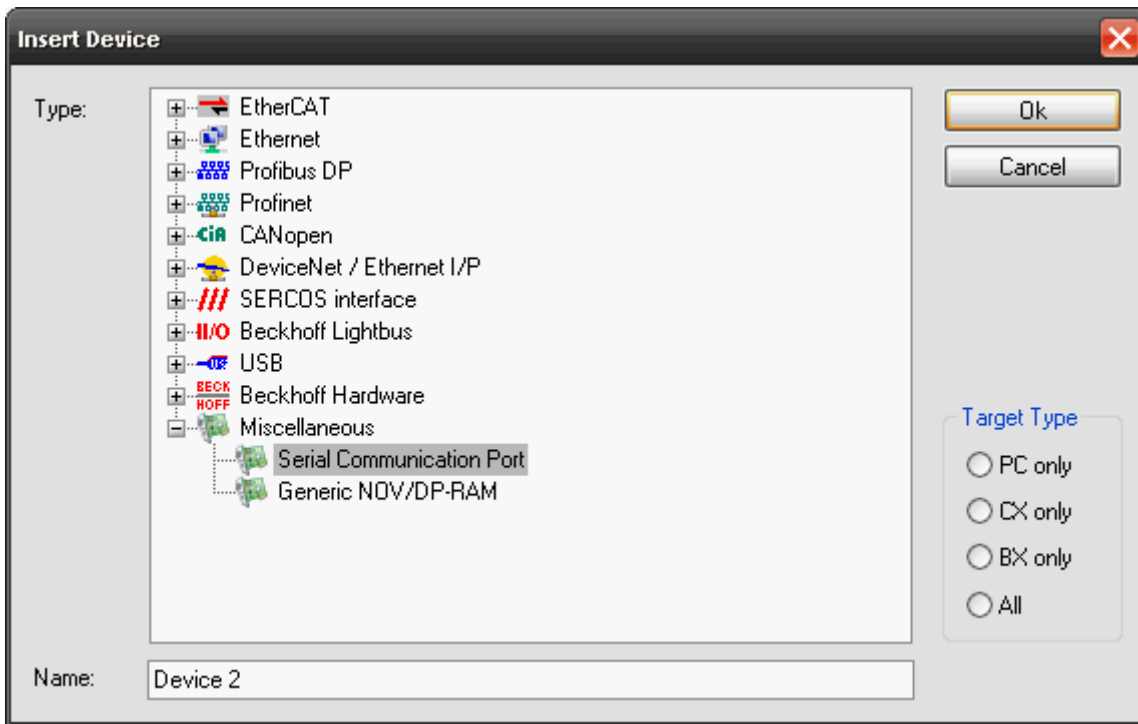

● Notice

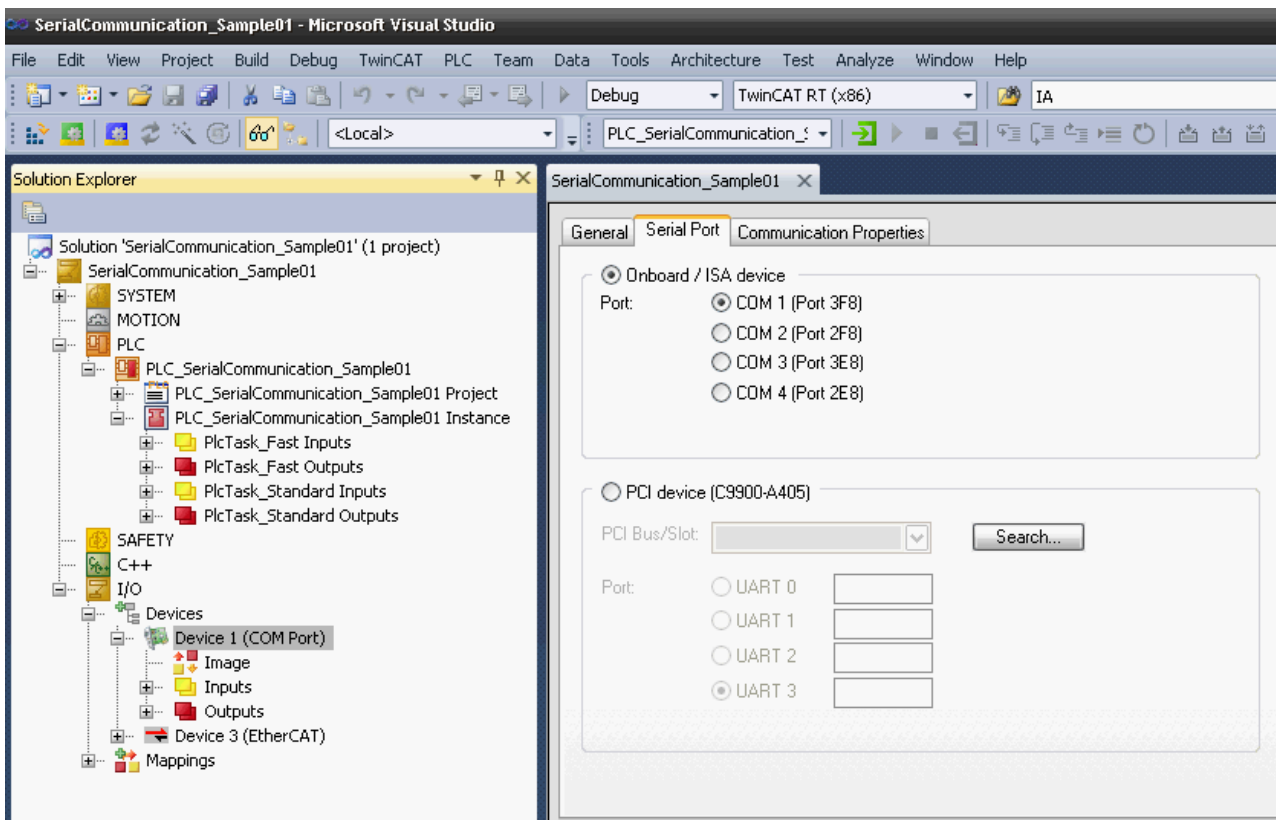

i Pay attention to the K-Bus update time if bus terminals KL6xxx and bus couplers BKxxxx are used. The K-Bus update time which can be figured out in the TwinCAT System Manager with a click on the bus coupler under I/O Configuration has to be less than the PLC task cycle time (10%-20%). If many terminals are connected to one bus coupler it may be necessary to increase the **task cycle time** to a **minimum of 2 ms**

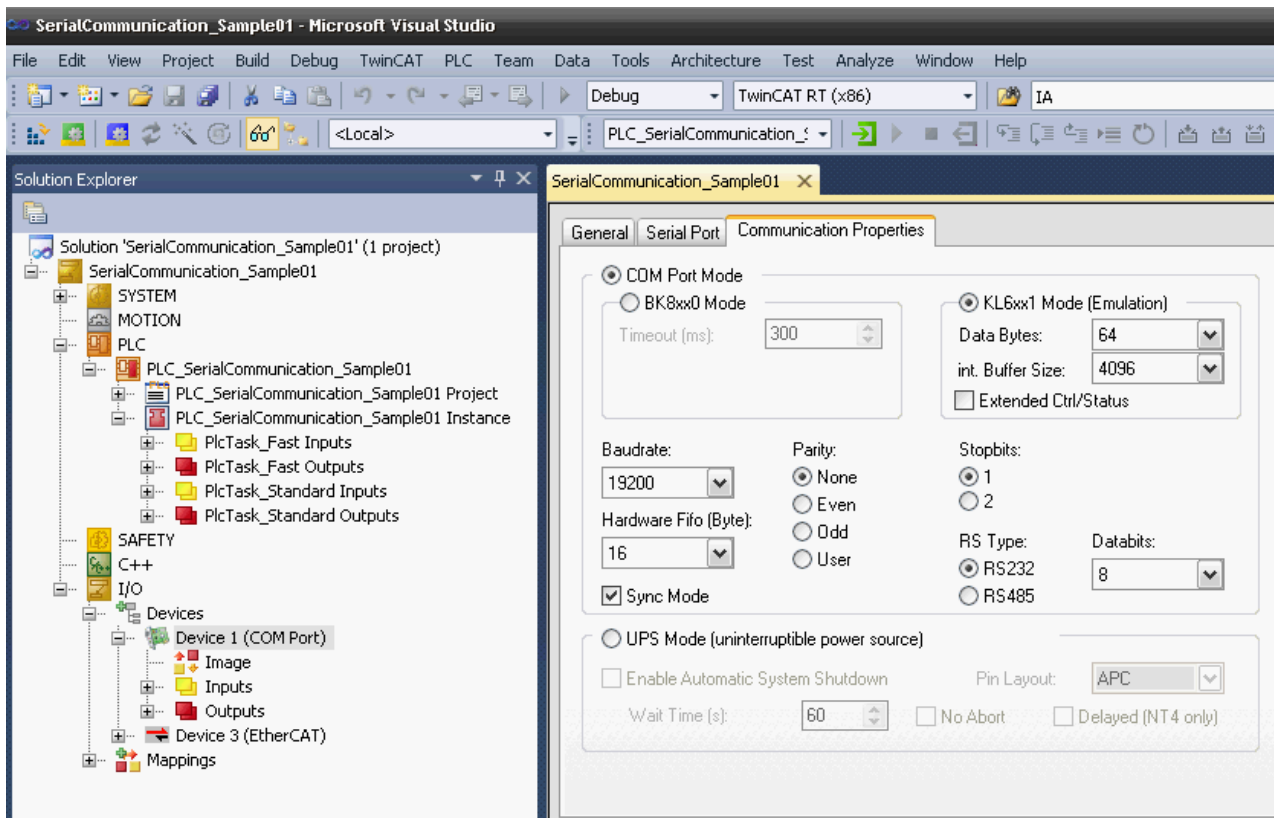

4.1.5 Serial PC Interface

The PC's standard serial interface is entered into the I/O configuration as a new I/O device.

After this the interface is configured:

Only the KL6xx1 emulation operation is supported. **Data bytes** must be set to **64 bytes**. The interface parameters are set appropriately in the application.

Sync mode: In *Sync mode*, communication with the interface hardware is synchronised with the communication task. This setting usually offers benefits at high baud rates, as long the cycle time of the communication task is short enough. At 115 kBaud, for example, 12 characters are received each millisecond. The interface therefore has to be operated with a maximum cycle time of 1 ms, in order to avoid overflow of the 16-byte hardware FIFO. If the cycle times are too long, there is a risk of buffer overflow.

If *Sync mode* is switched off, the interface is served via the Windows timer interrupt every millisecond, irrespective of the task cycle time. This mode is not real-time capable, and with high computer utilisation longer operating intervals may be experienced. In this case, with very high baud rates there is also a risk of buffer overflow.

It is recommended to activate *Sync mode* and to adjust the cycle time of the communication task to the baud rate in such a way that overflow of the 16-byte hardware buffer is avoided. For smaller baud rates and with a slower communication task, *Sync mode* may perhaps be deactivated.

The next step is to link the inputs and outputs to the corresponding data structures in the PLC (types [PcComInData](#) [► 61] and [PcComOutData](#) [► 61]) by means of multiple linking.

The new configuration is activated, and the system is restarted.

4.1.6 Serial EtherCAT Terminal

The serial EtherCAT terminal is entered into the system under a EtherCAT coupler.

Then the input and output data is linked with the corresponding PLC variables (of types [EL6inData22B \[► 61\]](#) bzw. [EL6outData22B \[► 61\]](#)).

The new configuration is activated, and the system is restarted.

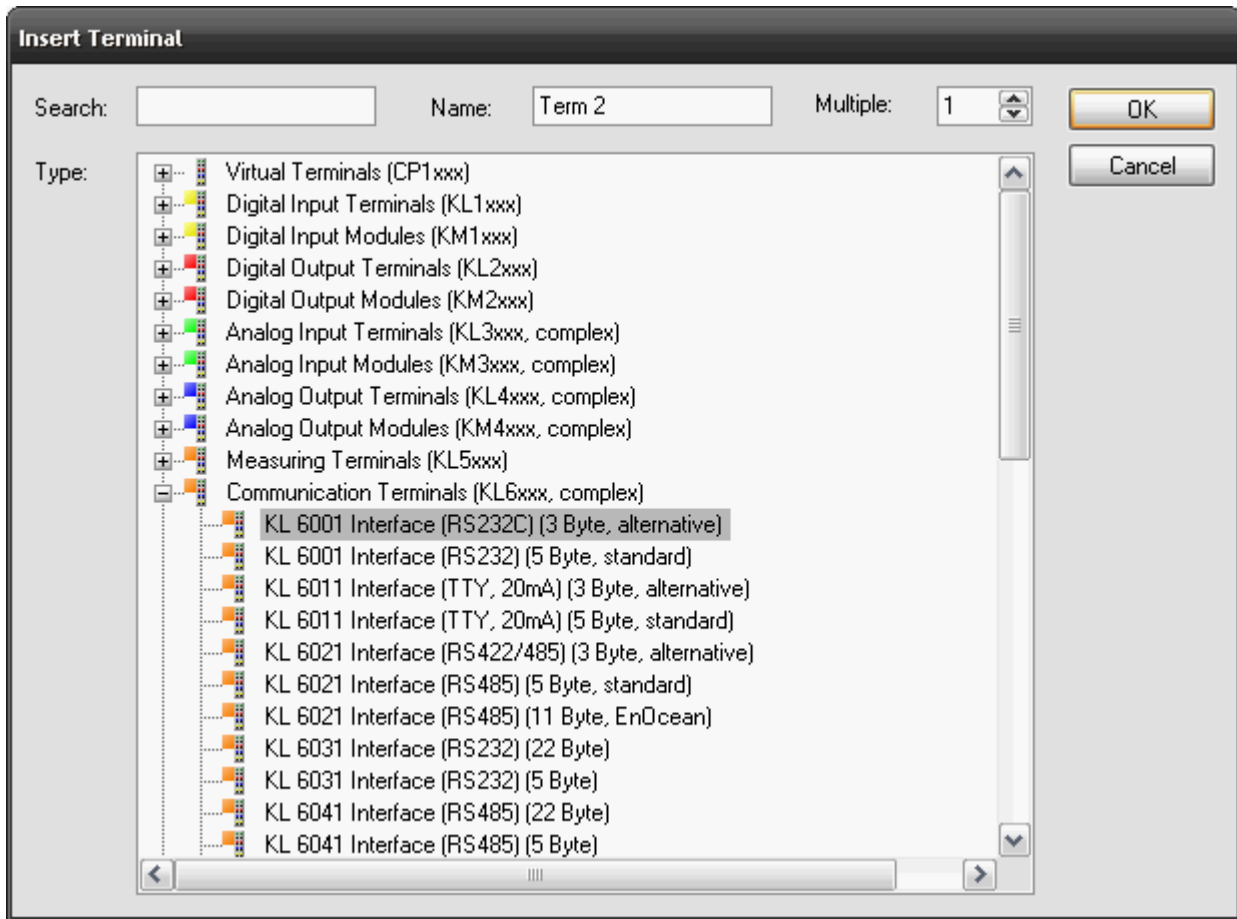

The serial settings are typically already set in the system configuration in the CoE of the EtherCAT terminal. Recommended is the insertion of these values into the startup-list to facilitate a hardware exchange.

The serial settings can be configured via CoE at run time too.

4.1.7 Serial Bus Terminal

KL6xxx in 3-Byte Mode

The serial bus terminal is entered into the system under a bus coupler.

Then the input and output data is linked with the corresponding PLC variables (of types [KL6inData](#) [► 59] and [KL6outData](#) [► 59]).

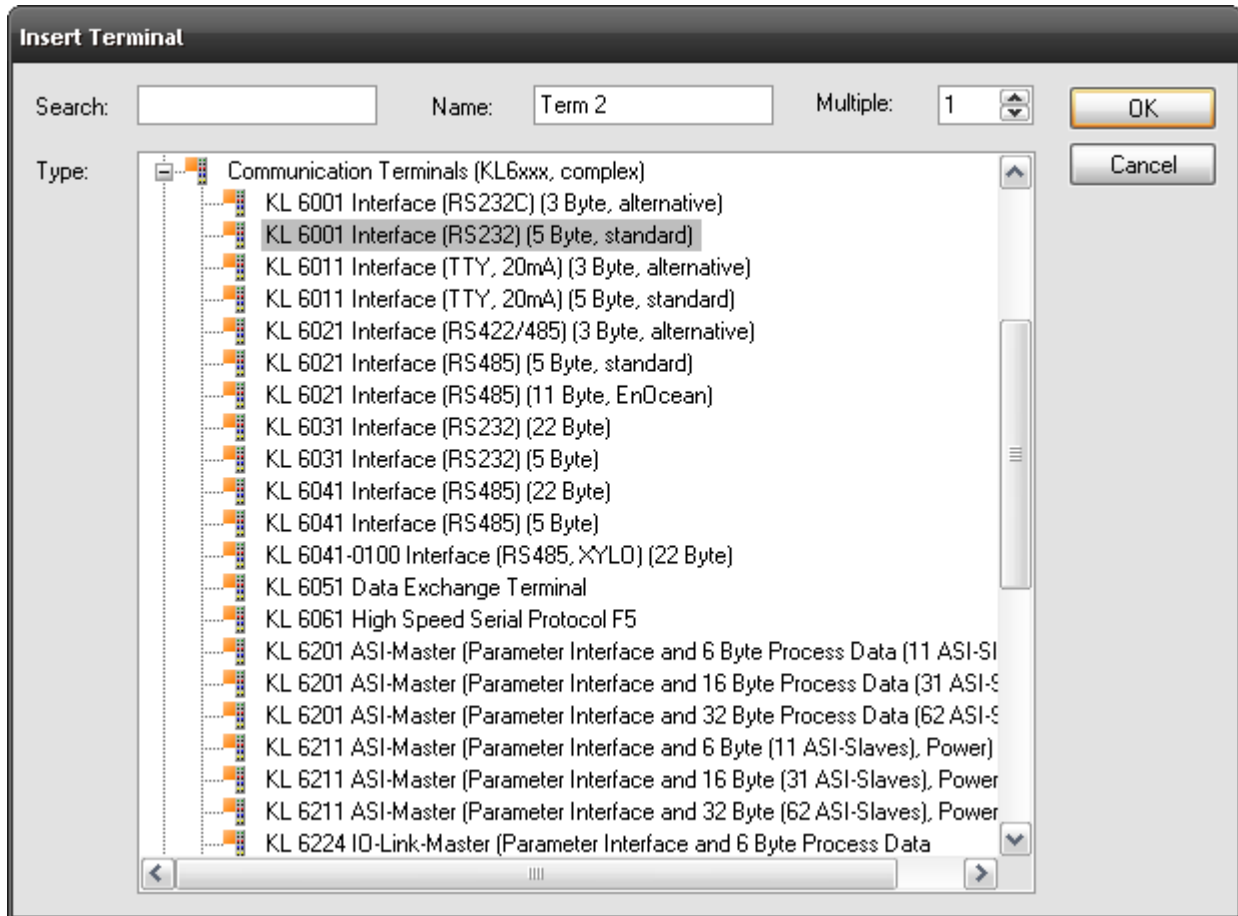

The new configuration is activated, and the system is restarted.

KL6xxx in 5-Byte Mode

Before a KL6xxx bus terminal can be used in 5-byte mode, it must be appropriately reconfigured. This can not be done through ComLib while running, but must be performed with the Beckhoff KS2000 configuration program. The terminal is then permanently set for 5-byte mode.

The serial bus terminal is now entered into the system under a bus coupler.

Then the input and output data are individually linked to the corresponding PLC variables (of types [KL6inData5B \[► 60\]](#) and [KL6outData5B \[► 60\]](#)).

The new configuration is activated, and the system is restarted.

4.2 Supported Hardware

The maximum effective data transfer rate (bps) depends on the cycle time (T) of the PLC and the number of bits per transferred data byte (LB = 1 start bit + n data bits + p parity bits + m stop bits).

The maximum effective data transfer rate is limited by the physical baud rate programmed into the Bus Terminal.

Example 1: When using an EL6001 Terminal and a baud rate of 9600 baud, the maximum cycle time is 6 ms.

Example 2: When using a PC COM port and a baud rate of 115200 baud, the maximum cycle time is 2 ms.

Serial EtherCAT Terminals

EL60xx in 22-byte mode (EP60xx in 22-byte mode)

The serial EtherCAT Terminal is operated in 22-byte mode, which means that packets of 22 data bytes can be transferred from and to the terminal. 3 PLC cycles are still necessary for each exchange.

$$\text{Bps} = (\text{LB} * 22/3) / T$$

The terminal is parameterized via the CoE Online tab in the TwinCAT System Manager (double-click the corresponding object).

Serial PC Interface

The serial physical PC interface (COM1, COM2, etc.) is handled by the TwinCAT system similarly to the serial Bus Terminal and EtherCAT Terminal and uses larger data transfer buffers than the serial Bus Terminal. The library uses a 64-byte buffer, so that up to 64 data bytes can be transferred simultaneously between the PLC and the interface driver. 3 PLC cycles are again needed for the exchange of a data block with the serial PC interface.

$$\text{Bps} = (\text{LB} * 64/3) / T$$

Virtual serial COM port

The TwinCAT system also supports a virtual serial COM port (COM1, ..., COM255), which is available in Windows. No configuration of the process image in the TwinCAT System Manager is required. The parameterization takes place directly in the PLC using the function blocks provided.

This communication connection is not real-time capable.

The baud rate can be set between 150 baud and 128000 baud.

● One port per target system

I The product is designed for use with a single virtual COM port per target system. However, in principle it is possible to use of several virtual COM ports on one system, provided function tests are carried out.

Serial Bus Terminal

KL6xxx in 3-byte mode

The standard version, as supplied, of the Beckhoff serial Bus Terminal is operated in 3-byte mode. In other words, a bus telegram can transmit or receive 3 data bytes to or from the terminal. Since every data exchange between the PLC and the Bus Terminal requires 3 PLC cycles, the effective transfer rate is one byte per cycle.

$$\text{Bps} = \text{LB} / T$$

Note: When selecting the cycle time for Bus Terminals, the K-bus update time of the Bus Coupler must be taken into account (see [Task configuration \[► 24\]](#)).

KL6xxx in 5-byte mode

The serial Bus Terminal can be reprogrammed offline by means of a configuration program (Beckhoff KS2000), so that, in 5-byte mode, 5 data bytes at a time can be transferred to or from the terminal. 3 PLC cycles are still necessary for each exchange. The effective data rate for a given cycle time of the PLC is thus 5/3 greater than in 3-byte mode.

$$\text{Bps} = (\text{LB} * 5/3) / T$$

The Bus Terminals cannot be re-programmed while the PLC is running, since the 3-byte and 5-byte modes differ in the register mapping and in the TwinCAT System Manager configuration.

Note: When selecting the cycle time for Bus Terminals, the K-bus update time of the Bus Coupler must be taken into account (see [Task configuration \[► 24\]](#)).

KL6xxx in 22-byte mode

The serial Bus Terminal can be supplied with a 24-byte process image as a special type, so that packets of 22 data bytes can be transferred to and from each terminal. 3 PLC cycles are still necessary for each exchange.

$$\text{Bps} = (\text{LB} * 22/3) / T$$

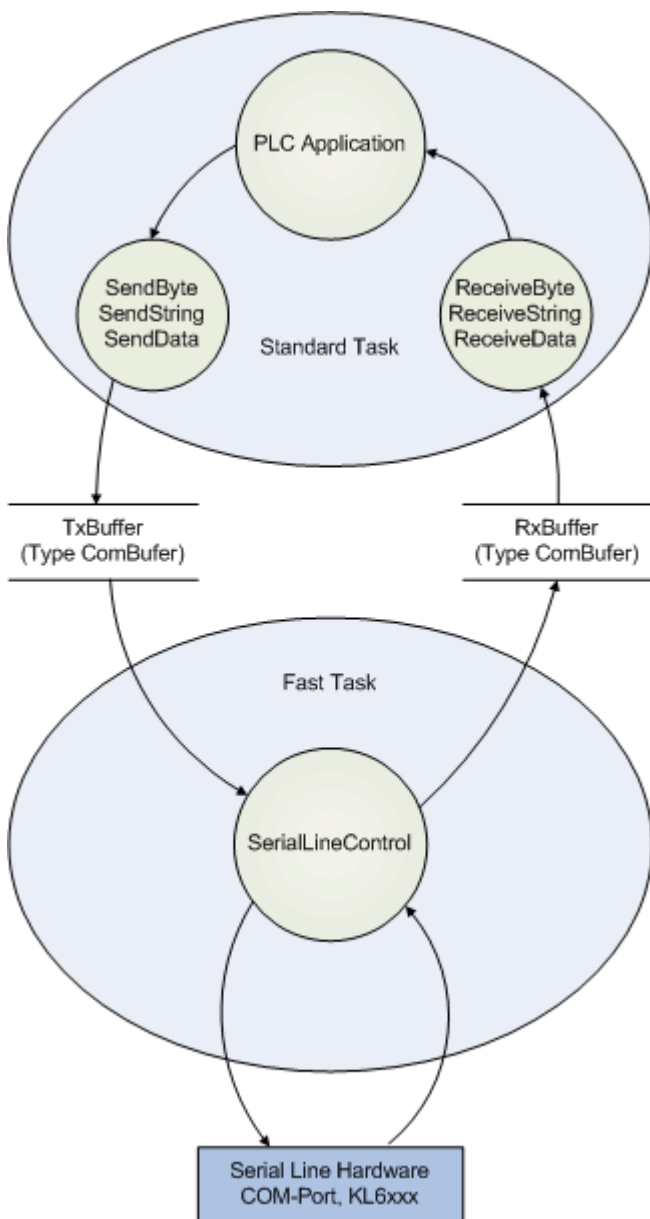

Notes: When selecting the cycle time for Bus Terminals, the K-bus update time of the Bus Coupler must be taken into account (see [Task configuration \[▶ 24\]](#)).

4.3 Communication Principle

Background Communication

As described in the section on [Supported Hardware \[▶ 31\]](#), the maximum effective data transfer rate depends in part on the PLC cycle time. So, for example, for communication with the serial bus terminal at an effective rate of 9600 bps, a cycle time of 1 ms is required. In many larger applications such a short cycle time for the whole PLC would heavily load the control computer.

Since for most applications longer cycle times of, for instance, 10 ms are more than adequate, it is possible with the aid of this library to decouple the data traffic between the PLC and the hardware from the rest of the PLC application. Two tasks are created in the PLC program for this purpose. The standard task runs with the conveniently long PLC cycle time of, for example, 10 ms, while a second communication task runs with a faster cycle taking, for example, 2 ms.

Data buffers of type [ComBufer \[▶ 57\]](#) are used to decouple the different speeds of the fast communication task and the standard task. They are written and read asynchronously.

The function blocks described later for receiving and sending data ([SendByte \[▶ 40\]](#), [SendString \[▶ 42\]](#), [SendData \[▶ 41\]](#) etc.) make use of only an additional data buffer for data exchange, and are thus independent of the hardware being used. In all cases, a communication block [SerialLineControl \[▶ 49\]](#) is called in the fast task, as well as the send and receive blocks. This handles the data traffic between the data buffer and the hardware with maximum speed in the background. If a COM port or terminal with 22 byte data interface is used a second task is not needed for low baud rates. Then the communication block [SerialLineControl \[▶ 49\]](#) can be called in the standard task.

The communication with virtual COM ports via [SerialLineControlADS \[▶ 50\]](#) uses an ADS server. Data exchange is handled asynchronously via ADS and is managed in intermediate buffers. The server itself receives the incoming data of the virtual COM port independent of the PLC. So the maximal effective data transfer don't depend on the PLC task cycle time.

Only the reaction time for incoming data would be decreased by a faster task cycle time. The full delay can't be defined because the virtual-com-port-drivers and the ADS server do not run in realtime.

The communication block *SerialLineControlADS* usually is called in the standard task. A second task is not needed.

5 API

5.1 Function blocks

5.1.1 Send + Receive

5.1.1.1 ReceiveByte

The ReceiveByte function block receives a single character from the interface corresponding to the input variable RxBuffer.

Interface

```
VAR_IN_OUT
  RxBuffer : ComBuffer;
END_VAR
VAR_OUTPUT
  ByteReceived : BOOL;
  ReceivedByte : BYTE;
  Error : ComError_t;
END_VAR
```

RxBuffer

RxBuffer is the receiving input data buffer of type [ComBuffer](#) [► 57] that corresponds with the used interface.

ByteReceived

If ByteReceived=TRUE after the call, then the data byte received is available in the output variable ReceivedByte. Otherwise no data has been received.

ReceivedByte

If ByteReceived=TRUE after the call, then the data byte received is available in the output variable ReceivedByte. Otherwise no data has been received.

Error

Returns the error code. The error code is defined by the data type [Error Codes ComError_t](#) [► 67] and is displayed in text form.

Example

Whenever a the ReceiveByte function block is processed in a PLC task that is running slower than the communication with the hardware, it must be remembered that more than one character can be made available in each PLC cycle. The characters received should therefore be read out within a loop:

```
REPEAT
  Receive (RXbuffer:=RXbuffer);
  IF Receive.ByteReceived THEN
    (* Zeichen auswerten *)
```

```

END_IF
UNTIL NOT Receive.ByteReceived
END_REPEAT

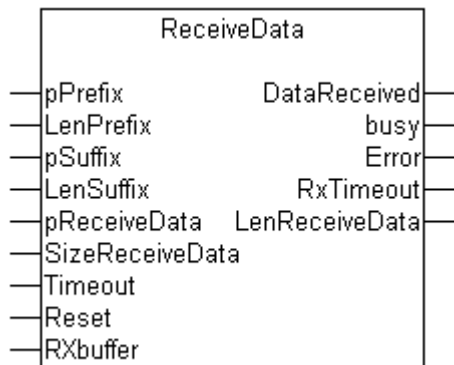

```

The number of passes through the loop is inevitably limited by the size of the receive data buffer (presently 300 bytes), so that an infinite loop need not be feared.

TwinCAT v3.1.4000	PC or CX (x86, x64)	Tc2_SerialCom

5.1.1.2 ReceiveData

ReceiveData receives data of any type from the interface corresponding to the input variable **RxBuffer**, storing it in the **ReceiveData** variable. The start and end of the data stream are recognized by various mechanisms, which can be combined with one another:

- **Prefix**

If a variable is passed to the input variable prefix, the first characters of the received data must be the same as this prefix. Other characters are discarded. If no prefix is supplied (null), the receive data starts with the first received character.

- **Suffix**

If an input variable suffix is supplied, the input data is read until the end of the receive data agrees with the suffix. If the received data reach the maximum length **SizeReceiveData**, a **COMERROR_DATASIZEOVERRUN** error is generated.

- **Block size**

If no suffix is specified, characters are received up to **SizeReceiveData**.

- **Timeout**

If a timeout is supplied to the block, then characters will be received until a correspondingly long interval has elapsed after reception of a character. The receive data consists of the characters received up to that point. If timeout is 0, characters are received up to **SizeReceiveData** without time monitoring.

As soon as the output **DataReceived** becomes TRUE, the receive data is ready in the **ReceiveData** variable. The number of characters received is given in **LenReceiveData**.

Interface

```

VAR_INPUT
  pPrefix : POINTER TO BYTE;
  LenPrefix : BYTE;
  pSuffix : POINTER TO BYTE;
  LenSuffix : BYTE;
  pReceiveData : POINTER TO BYTE;
  SizeReceiveData : DINT;
  Timeout : TIME;
  Reset : BOOL;
END_VAR
VAR_OUTPUT

```

```
DataReceived : BOOL;
busy : BOOL;
Error : ComError_t;
RxTimeout : BOOL;
LenReceiveData : UDINT;
END_VAR
VAR_IN_OUT
  RXbuffer : ComBuffer;
END_VAR
```

pPrefix

pPrefix is the address of any kind of data structure that is passed to the block using ADR(variable name). LenPrefix indicates the number of data bytes in the prefix.

LenPrefix

LenPrefix indicates the number of data bytes in the prefix.

pSuffix

pSuffix is the address of any kind of data structure that is passed to the block using ADR(variable name).

LenSuffix

LenSuffix indicates the number of data bytes in the suffix.

pReceiveData

pReceiveData is the address of the receive data, and is found by means of ADR(receive data). The receive data is placed in the variables to which pReceiveData points.

SizeReceiveData

SizeReceiveData is found by means of SIZEOF(receive data), and indicates the maximum size of the receive data.

Timeout

Timeout defines the maximum interval between two received characters. Timeout monitoring becomes effective after the first character. This means that timeout cannot be used to detect whether an expected telegram arrives or not. This is monitored externally.

Reset

Setting the Reset input will reset the block from the receive state into the initial state. Resetting is only necessary in exceptional cases, if, for example, the expected data could not be received and the block remains busy.

DataReceived

DataReceived becomes TRUE as soon as the receive data is valid. The output remains TRUE for precisely one cycle, which means that it is necessary to evaluate the received data immediately.

Busy

Busy becomes TRUE after the first character has been received, and goes FALSE as soon as the data has been received or an error has occurred.

Error

If a fault occurs, Error will contain an error code. The error code is defined by the data type ComError_t [► 67], and this is used to display it in text form at runtime.

RxTimeout

RxTimeout becomes TRUE if the maximum interval between two received characters is exceeded. This causes data reception to be aborted, and the characters received up to this point are available. If a suffix is not being used, then detection of a timeout does not represent a fault, but indicates the normal end of the receive data. If, on the other hand, a suffix was being used, it was not possible to receive this.

LenReceiveData

LenReceiveData indicates the actual number of data bytes received, and can be less than or equal to SizeReceiveData.

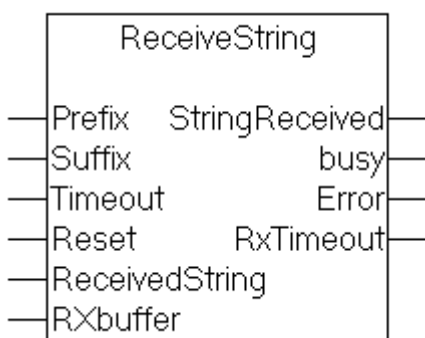

RxBuffer

RxBuffer is the receive data buffer of type [ComBuffer](#) [[▶ 57](#)] corresponding to the interface in use.

Requirements

TwinCAT v3.1.4000	PC or CX (x86, x64)	Tc2_SerialCom

5.1.1.3 ReceiveString

ReceiveString receives a string of characters from the interface corresponding to the input variable **RxBuffer**, storing it in the output variable **ReceivedString**. The start and end of the string are recognized by various mechanisms, which can be combined with one another:

- **Prefix**
If a string is supplied to the input variable Prefix, the first characters must correspond to this prefix. Other characters are discarded. If no prefix is supplied (an empty string), the received string starts with the first received character.
- **Suffix**
If a string is supplied to the input variable Suffix, the input data is read until the end of the received string corresponds to the suffix. If during this process the received data reach the maximum length of the receive string, a COMERROR_STRINGOVERRUN error is generated. If an empty string is supplied as the suffix, a timeout must be defined instead, since otherwise the end of the character string cannot be recognized.
- **Timeout**
If a timeout is supplied to the function block, then characters will be received until a correspondingly long interval has elapsed after reception of a character. The received string consists of the characters received up to that point. Suffix and timeout may be combined. If a suffix is supplied, the timeout may be 0.

As soon as the output StringReceived becomes TRUE, the received data are ready in the ReceivedString variable.

Alternative

ReceivedString has a standard length of 80 characters. For some applications this length may be too short. In this case the [ReceiveString255](#) [[▶ 39](#)] function block can be used. The only difference is a length of 255 characters for the ReceivedString.

Interface

```
VAR_INPUT
  Prefix : STRING;
  Suffix : STRING;
```

```

    Timeout : TIME;
    Reset : BOOL;
END_VAR
VAR_OUTPUT
    StringReceived : BOOL;
    busy : BOOL;
    Error : ComError_t;
    RxTimeout : BOOL;
END_VAR
VAR_IN_OUT
    ReceivedString : STRING;
    RXbuffer : ComBuffer;
END_VAR

```

Reset

Setting the Reset input will reset the block from the receive state into the initial state. Reset is only necessary in exceptional cases, such as when the expected string can not be received.

Error

Returns the error code. The error code is defined by the data type Error Codes ComError_t [▶ 67] and is displayed in text form.

RxBuffer

RxBuffer is the receive data buffer of type ComBuffer [▶ 57] corresponding to the interface in use..

TwinCAT v3.1.4000	PC or CX (x86, x64)	Tc2_SerialCom

5.1.1.4 ReceiveString255

ReceiveString receives a string of characters from the interface corresponding to the input variable **RxBuffer**, storing it in the output variable **ReceivedString**. The start and end of the string are recognized by various mechanisms, which can be combined with one another:

- **Prefix**
If a string is supplied to the input variable Prefix, the first characters must correspond to this prefix. Other characters are discarded. If no prefix is supplied (an empty string), the received string starts with the first received character.
- **Suffix**
If a string is supplied to the input variable Suffix, the input data is read until the end of the received string corresponds to the suffix. If during this process the received data reach the maximum length of the receive string, a COMERROR_STRINGOVERRUN error is generated. If an empty string is supplied as the suffix, a timeout must be defined instead, since otherwise the end of the character string cannot be recognized.

- **Timeout**

If a timeout is supplied to the function block, then characters will be received until a correspondingly long interval has elapsed after reception of a character. The received string consists of the characters received up to that point. Suffix and timeout may be combined. If a suffix is supplied, the timeout may be 0.

As soon as the output `StringReceived` becomes `TRUE`, the received data are ready in the `ReceivedString` variable.

Interface

```
VAR_INPUT
  Prefix : STRING;
  Suffix : STRING;
  Timeout : TIME;
  Reset : BOOL;
END_VAR
VAR_OUTPUT
  StringReceived : BOOL;
  busy : BOOL;
  Error : ComError_t;
  RxTimeout : BOOL;
END_VAR
VAR_IN_OUT
  ReceivedString : STRING(255);
  RXbuffer : ComBuffer;
END_VAR
```

Reset

Setting the Reset input will reset the function block from the receive state into the initial state. Resetting is only necessary in exceptional cases, for example if the expected string could not be received and the function block remains busy.

Error

If a fault occurs, Error will contain an error code. The error code is defined by the data type `ComError_t` [► 67], and this is used to display it in text form at runtime.

RxBuffer

`RxBuffer` is the received data buffer of type `ComBuffer` [► 57], which corresponds to the interface used.

Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT v3.1.4000	PC or CX (x86, x64)	Tc2_SerialCom

5.1.1.5 SendByte

SendByte sends a single character to the interface that corresponds to the input variable **TxBuffer** (of type `ComBuffer` [► 57]). For as long as the output **Busy**=`TRUE`, the transmission is not completed. The character was successfully sent when **Busy**=`FALSE` and **Error**=0. The output **Busy** does not become `TRUE`, if the data could already be sent with the first call.

As long as the send data buffer can still accept data, more than one character can be sent in a single PLC cycle. This is, however, only worthwhile if the buffered characters will be transmitted to the hardware by a faster communication task.

Interface

```

VAR_INPUT
    SendByte : BYTE;
END_VAR
VAR_OUTPUT
    Busy : BOOL;
    Error : ComError_t;
END_VAR
VAR_IN_OUT
    TxBuffer : ComBuffer;
END_VAR
    
```

Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT v3.1.4000	PC or CX (x86, x64)	Tc2_SerialCom

5.1.1.6 SendData

SendData sends the content of a variable of any type to the interface that corresponds to the input variable **TxBuffer** (of type ComBuffer [[▶ 57](#)]). For as long as **Busy**=TRUE, the transmission is not completed. The data has successfully been sent when **Busy**=FALSE and Error=0.

Interface

```

VAR_INPUT
    pSendData : POINTER TO BYTE;
    Length : UDINT;
END_VAR
VAR_OUTPUT
    Busy : BOOL;
    Error : ComError_t;
END_VAR
VAR_IN_OUT
    TXbuffer : ComBuffer;
END_VAR
    
```

pSendData

pSendData is the address of the send data, and is determined by means of ADR(send data).

The data must not be changed as long as Busy is TRUE and the transmission is not completed.

Length

Length is the number of data bytes to be sent, and can be smaller than or equal to the size of the data structure being used. If the entire contents of a variable are to be sent, then the length can be determined using SIZEOF (send data).

Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT v3.1.4000	PC or CX (x86, x64)	Tc2_SerialCom

5.1.1.7 SendString

SendString sends a character string to the interface that corresponds to the input variable **TxBUFFER** (of type [ComBuffer](#) [► 57]). For as long as the output **Busy**=TRUE, the transmission is not completed. The data has successfully been sent when **Busy**=FALSE and Error=0. The output Busy does not become TRUE, if the data could already be sent with the first call.

Interface

```

VAR_INPUT
    SendString : STRING;
END_VAR
VAR_OUTPUT
    Busy : BOOL;
    Error : ComError_t;
END_VAR
VAR_IN_OUT
    TXbuffer : ComBuffer;
END_VAR

```

Alternative

i SendString has a standard length of 80 characters. For some applications a longer string is desirable. In this case the function block [SendString255](#) [► 42] can be used. The only difference is a length of 255 characters for the SendString.

Requirements

5.1.2 Configuration

5.1.2.1 ComReset

ComReset resets the connected serial hardware. This clears the internal hardware send and receive buffers. The function block supports a variety of serial hardware, such as the serial PC interface and the KL6xxx Serial Bus Terminals.

Note
 Note: The function block does not clear the data buffer of type [ComBuffer](#) [[▶ 57](#)] internal to the PLC. For initialization purposes, this can be separately cleared with the [ClearComBuffer](#) [[▶ 43](#)] function block.

Interface

```

VAR_INPUT
  Execute   : BOOL;
  pComIn   : POINTER TO BYTE
  pComOut  : POINTER TO BYTE
  SizeComIn : UINT;
END_VAR
VAR_OUTPUT
  Done     : BOOL;
  Busy    : BOOL;
  Error   : BOOL;
  ErrorID : UDINT;
END_VAR

```

Execute : A rising edge at the Execute input resets the connected serial hardware.

pComIn: Universal pointer to the input variable of the process data for the serial hardware (data types [KL6inData](#) [► 59], [KL6inData5b](#) [► 59], [PcComInData](#) [► 61]). The pointer is assigned with the *ADR()* function.

pComOut: Universal pointer to the output variable of the process data for the serial hardware (data types [KL6outData](#) [► 59], [KL6outData5b](#) [► 59], [PcComOutData](#) [► 61]). The pointer is assigned with the *ADR()* function.

SizeComIn: Size of the input process image of the serial hardware being used. The size is determined and assigned with the *SIZEOF()* function.

Done : The Done output becomes TRUE when the function has been carried out without error.

Busy: The Busy output becomes TRUE in response to rising edge at Execute, and remains TRUE for as long as the block is performing its function.

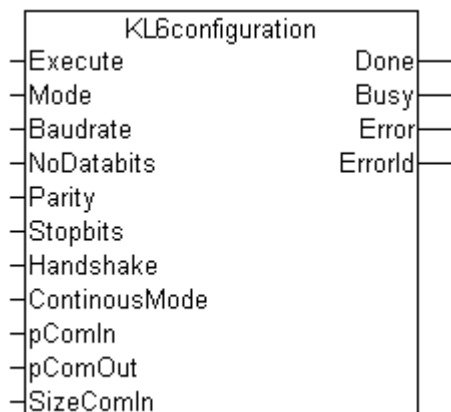

Error: The *Error* output becomes TRUE as soon as an error occurs.

ErrorID : The *ErrorID* output provides an error code when an error occurs.

5.1.2.2 KL6Configuration

The KL6configuration function block initializes and configures a KL6xxx Serial Bus Terminal.

The function block uses the standard register communication for KL terminals for the configuration. For EL EtherCAT Terminals this register communication is not available. EL terminals can be configured with function blocks from the EtherCAT library (FB_EcCoeSdoWrite).

Interface

```

VAR_INPUT
    Execute      : BOOL;
    Mode         : ComSerialLineMode_t;
    Baudrate     : UDINT;      (* 115200, 57600, 38400, 19200, 9600, 4800, 2400, 1200 *)

    Busy        : BOOL;
    Error       : BOOL;
    ErrorId     : ComError_t;
END_VAR

```

Execute

A rising edge at the Execute input resets the connected serial hardware.

Mode

The mode input of type [ComSerialLineMode_t](#) [▶ 62] clearly determines which sequential hardware is used.

Baudrate

The baud rate, provided it is supported by the serial hardware.

NoDatabits

The number of user data bits in one data byte.

Parity

The type of the parity bit ([ComParity_t](#) [▶ 62]) of a data byte.

Stopbits

The number of stop bits per data byte

Handshake

The type of handshake used ([ComHandshake_t](#) [▶ 62]), provided it is supported by the serial hardware.

ContinuousMode

Switches on continuous transmission, provided this is supported by the serial hardware.

If ContinuousMode is TRUE, transmitted data is not sent out by the serial hardware until the hardware transmit buffer is full. This means that there are no time gaps in the transmission, provided the quantity of data is similar in size to the hardware transmit buffer. Continuous mode is only necessary in special cases in which the end device reacts to time gaps with a time-out.

pComIn

Universal pointer to the input variable of the process data for the serial hardware (data types [KL6inData](#) [▶ 59], [KL6inData5b](#) [▶ 60], [KL6inData22b](#) [▶ 60], [PcComInData](#) [▶ 61]). The pointer is assigned with the *ADR()* function.

pComOut

Universal pointer to the output variable of the process data for the serial hardware (data types [KL6outData](#) [▶ 59], [KL6outData5b](#) [▶ 60], [KL6outData22b](#) [▶ 60], [PcComOutData](#) [▶ 61]). The pointer is assigned with the *ADR()* function.

SizeComIn

Size of the input process image of the serial hardware being used. The size is determined and assigned with the *SIZEOF()* function.

Done

The Done output becomes TRUE when the function has been carried out without error.

Busy

The Busy output becomes TRUE in response to rising edge at Execute, and remains TRUE for as long as the block is performing its function.

Error

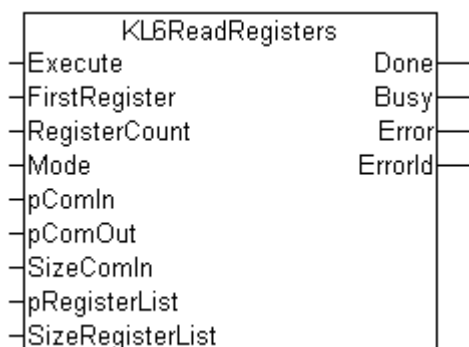

The *Error* output becomes TRUE as soon as an error occurs.

ErrorID

In the event of an error the *ErrorID* output issues an error code of type [ComError_t](#) [▶ 67].

5.1.2.3 KL6ReadRegisters

The KL6ReadRegisters function block reads one or several registers of a KL6xxx serial Bus Terminal.

Interface

```

VAR_INPUT
  Execute      : BOOL;
  FirstRegister : UINT;
  RegisterCount : UINT;
  Mode         : ComSerialLineMode_t;
  pComIn       : POINTER TO ARRAY[0..65] OF BYTE; (* for universal register communication *)
  pComOut      : POINTER TO ARRAY[0..65] OF BYTE; (* for universal register communication *)
  SizeComIn    : UINT;
  pRegisterList : POINTER TO ARRAY[0..63] OF ComRegisterData_t;
  SizeRegisterList : UINT;
END_VAR
VAR_OUTPUT
  Done    : BOOL;
  Busy    : BOOL;
  Error   : BOOL;
  ErrorId : ComError_t;
END_VAR

```

Execute : A rising edge at the Execute input starts the read process.

FirstRegister : Specifies the first register to be read. From this register number (which may range between 1 and 64), *RegisterCount* data are read and stored in the register list of type *ComRegisterData_t*.

If no coherent register range is to be read, the value 16#FFFF can be stored in *FirstRegister*. In this case the user has to initialize the register numbers to be read in the register list before the block is triggered. In this case *RegisterCount* is not used.

RegisterCount : Specifies the number of registers to be read. The block reads a coherent register range from *FirstRegister* and stores the data in the register list.

Mode : The Mode input specifies unambiguously which serial hardware is being used ([ComSerialLineMode_t](#) [▶ 62]).

pComIn: Universal pointer to the input variable of the process data for the serial hardware (data types [KL6inData](#) [[▶ 59](#)], [KL6inData5b](#) [[▶ 60](#)], [KL6inData22b](#) [[▶ 60](#)], [PcComInData](#) [[▶ 61](#)]). The pointer is assigned with the *ADR()* function.

pComOut: Universal pointer to the output variable of the process data for the serial hardware (data types [KL6outData](#) [[▶ 59](#)], [KL6outData5b](#) [[▶ 60](#)], [KL6outData22b](#) [[▶ 60](#)], [PcComOutData](#) [[▶ 61](#)]). The pointer is assigned with the *ADR()* function.

SizeComIn: Size of the input process image of the serial hardware being used. The size is determined and assigned with the *SIZEOF()* function.

pRegisterList : Start address of a register list of type [ComRegisterData t](#) [[▶ 57](#)]. The start address can be determined with *ADR(register list)*.

SizeRegisterList : Size of the register list in bytes. The size can be determined via *SIZE (register list)*. The list may have between 1 and 64 entries.

Done : The Done output becomes TRUE when the function has been carried out without error.

Busy: The Busy output becomes TRUE in response to rising edge at Execute, and remains TRUE for as long as the block is performing its function.

Error: The *Error* output becomes TRUE as soon as an error occurs.

ErrorID : The *ErrorID* output provides an error code of type [ComError t](#) [[▶ 67](#)] when an error occurs.

5.1.2.4 KL6WriteRegisters

The function block KL6WriteRegisters writes data to one or several registers of a serial KL6xxx Bus Terminal.

Interface

```

VAR_INPUT
    Execute      : BOOL;
    Mode         : ComSerialLineMode_t;
    pComIn       : POINTER TO ARRAY[0..65] OF BYTE; (* for universal register communication *)
    pComOut      : POINTER TO ARRAY[0..65] OF BYTE; (* for universal register communication *)
    SizeComIn    : UINT;
    pRegisterList : POINTER TO ARRAY[0..63] OF ComRegisterData_t;
    SizeRegisterList : UINT;

    Busy      : BOOL;
    Error      : BOOL;
    ErrorId   : ComError_t;
END_VAR
    
```

Execute

A rising edge at the Execute input starts the write process.

The *register list* must be initialized before the block is triggered. This means the register numbers and register content must be entered in the list.

Mode : The Mode input specifies unambiguously which serial hardware is being used ([ComSerialLineMode_t](#) [[▶ 62](#)]).

pComIn

Universal pointer to the input variable of the process data for the serial hardware (data types [KL6inData](#) [[▶ 59](#)], [KL6inData5b](#) [[▶ 60](#)], [KL6inData22b](#) [[▶ 60](#)], [PcComInData](#) [[▶ 61](#)]). The pointer is assigned with the *ADR()* function.

pComOut

Universal pointer to the output variable of the process data for the serial hardware (data types [KL6outData](#) [[▶ 59](#)], [KL6outData5b](#) [[▶ 60](#)], [KL6outData22b](#) [[▶ 60](#)], [PcComOutData](#) [[▶ 61](#)]). The pointer is assigned with the *ADR()* function.

SizeComIn

Size of the input process image of the serial hardware being used. The size is determined and assigned with the *SIZEOF()* function.

pRegisterList

Start address of a register list of type [ComRegisterData_t](#) [[▶ 57](#)]. The start address can be determined with *ADR(register list)*. The *register list* must be initialized before the block is triggered. This means the register numbers and register content must be entered in the list.

SizeRegisterList

Size of the register list in bytes. The size can be determined via *SIZE (register list)*. The list may have between 1 and 64 entries.

Done

The Done output becomes TRUE when the function has been carried out without error.

Busy

The Busy output becomes TRUE in response to rising edge at Execute, and remains TRUE for as long as the block is performing its function.

Error

The *Error* output becomes TRUE as soon as an error occurs.

ErrorID

In the event of an error the *ErrorID* output issues an error code of type [ComError_t](#) [[▶ 67](#)].

5.1.3 Background Communication

5.1.3.1 SerialLineControl

The SerialLineControl function block looks after the communication between a serial interface (KL60xx, EL60xx or COM interface) and the PLC. The function block is called cyclically, and places received data into the *RxBuffer*. Data made available in the *TxBuffer* transmit buffer is sent to the interface at the same time.

Because the function operates independently of the application, it is referred to as background communication and can, particularly in the case of serial bus terminals, also operate in a fast task (see [Communication concept \[▶ 33\]](#) and [Supported hardware \[▶ 31\]](#)).

5.1.3.2 SerialLineControlADS

SerialLineControlADS	
Connect	PortOpened
SerialCfg	Error
NetId	ErrorID
Timeout	Busy
TxBuffer ▸	TxBufCount
RxBuffer ▸	RxBufCount

The function block `SerialLineControlADS` handles the communication between a virtual serial interface and the PLC. The function block is called cyclically, and places received data into the `RxBuffer`. Data made available in the `TxBuffer` transmit buffer is sent to the interface at the same time.

Since the function is handled independent of the application, it is referred to as background communication. Just like the function block `Serial Line Control`, it can also be handled in a fast task (see [Communication concept \[▶ 33\]](#) and [Supported hardware \[▶ 31\]](#)).

When the function block is called cyclically and the input `Connect` is set, the parameterized serial COM port is opened automatically.

This COM port is then blocked for other applications. To enable the COM port for access from another application, you can reset the input `Connect`. The current port is then closed. If a different COM port or a different parameterization is selected in the input structure `SerialCfg` [[▶ 58](#)], the current port is closed automatically and the new port is opened.

Interface

```
FUNCTION_BLOCK SerialLineControlADS
VAR_INPUT
    Connect      : BOOL;                (* connect to serial port [TRUE=connect, FALSE=disconnect] *)
    SerialCfg    : ComSerialConfig;

    Timeout      : TIME :=DEFAULT_ADS_TIMEOUT; (* Timeout for ADS calls *)
END_VAR
VAR_IN_OUT
    TxBuffer     : ComBuffer; (* serial Tx ComBuffer *)
    RxBuffer     : ComBuffer; (* serial Rx ComBuffer *)
END_VAR
VAR_OUTPUT

    Error        : BOOL;                (* 'TRUE' if an error occurred *)
    ErrorID      : UDINT;               (* Displays the error code; 0 = no error *)
    Busy         : BOOL;                (* 'TRUE' if internal ADS communication is busy *)
    TxBufCount   : UDINT;               (* number of bytes in internal Tx buffer *)
    RxBufCount   : UDINT;               (* number of bytes in internal Rx buffer *)
END_VAR
```

Input variables

- Connect** To open a connection to a serial port, `Connect` has to be TRUE. Is `Connect` FALSE specified, an open port will get closed. Note: If this input variable switches, it can take up to 6 times of the `Timeout` delay to finish the requested action. Therefore the application has to look after the output `PortOpened` and wait until it takes the desired state.
- SerialCfg** This input structure defines a COM port and with which parameters the COM port is used and opened. For details see the description of `ComSerialConfig` [[▶ 58](#)].
- NetId** For local access don't specify this input or allocate an empty string. For remote access to another TwinCAT target system specify its AMS Net Id.
- Timeout** Specifies a maximum length of time for the execution of the function block. The default value is 5 seconds. (At least 1000ms should be adjusted.)

Input/output variables

- TxBuffer** Buffer of type `ComBuffer` [[▶ 57](#)] with transmit data for the serial hardware being used. The transmit buffer is filled by functions such as `SendByte` [[▶ 40](#)], `SendData` [[▶ 41](#)] or `SendString` [[▶ 42](#)].

RxBuffer Buffer of type [ComBuffer](#) [▶ 57] into which received data is placed. The receive buffer is read by functions such as [ReceiveByte](#) [▶ 35], [ReceiveData](#) [▶ 36] or [ReceiveString](#) [▶ 38].

Output variables

- PortOpened** This output indicates whether the selected serial port is opened and linked.
- Error** The *Error* output becomes TRUE as soon as an error occurs.
- ErrorID** The *ErrorID* output provides an error code when an error occurs. A list of possible values and notes on troubleshooting can be found in section [Error codes](#) [▶ 68].
- Busy** This output is TRUE as long as the internal ADS communication of the function block is active.
- TxBufCount** The output *TxBufCount* indicates whether the internal PLC buffer still contains data bytes that have not yet been sent.
- RxBufCount** The output *RxBufCount* indicates whether the internal PLC buffer still contains received data bytes that have not yet been transferred to the *RxBuffer*. The application must ensure that the received data are read fast enough from the *RxBuffer*.

Connection to Hardware

The P3964R function block handles the 3964R protocol. The background communication, which is handled by a separate block (PcComControl, KL6Control and KL6Control5B) decides on the hardware interface used. The associated data buffers, Txbuffer and Rxbuffer of type ComBuffer [▶ 57] , are passed to the P3964R block.

Sending

Send data are entered into the Txdata send data buffer of type P3694buffer [▶ 62] by the PLC. The number of data bytes entered is passed on in Txcount, and then Txstart is set to TRUE. Txstart is edge-triggered, so that before a new attempt to send is made, the block must be called with Txstart=FALSE. While sending, Txbusy=TRUE. Once the data has been successfully transferred, Txready changes to TRUE.

Receiving

RxStart is set to TRUE to receive data. After a complete data set has been received, the Rxready output goes TRUE and Rxcount data bytes are ready in the receive data buffer Rxdata of type P3694buffer [▶ 62]. Rxstart is also edge-triggered. While receiving, Rxbusy=TRUE.

Interrupt reception

The P3964R block can be used in either send or receive mode. It is worthwhile switching the block to receive when transmission is not taking place. As long as the block is in receive mode, but no start character has been received from the other end, a rising edge at Txstart can interrupt the reception and initiate the sending of data. After the transfer the block goes into its initial state (Busy=FALSE), and is only switched over to receive by a new edge at Rxstart.

Priority

In a 3964R data connection, either end may send at any time. If both ends attempt to send at the same time, there is a collision. In that case, the end with the lower priority goes into receive mode, while the end with the higher priority sends again. For this reason, when priority is low the RxReady output can be TRUE, even though data are to be sent. The data in RxData may then require evaluation. The setting of the priority at the two ends is to be agreed.

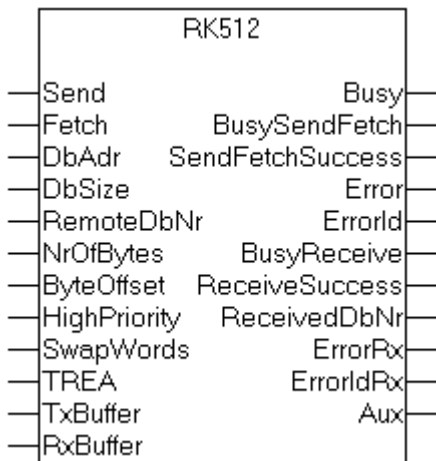

Error

In the event of an error the block goes into its initial state (Busy=FALSE), and the Error output goes TRUE. The ErrorId returns the error code [▶ 71]. ErrorState provides information about the state in which the error occurred when the internal protocol structure is known.

Operating Modes

The RK512 function block distinguishes two quite different operating modes, passive and active operation.

In the passive mode the block waits for and answers data telegrams from the communication partner. The communication partner can transmit the data blocks to the local controller, or can fetch data from it. In order for the RK512 function block to be able to accept data blocks or to return data that has been requested, it must previously be configured for passive operation by [RK512](#) |► 56|

In active mode, the RK512 function block either sends data blocks to the communication partner (SEND) or fetches them from it (FETCH).

As long as neither of the function block's *Send* or *Fetch* inputs switch it into active operation it waits for telegrams from communication partners, changing when appropriate into passive mode. The two operating modes can be mixed. In that case the RK512 function block attempts to synchronise the telegram traffic. Since mixed mode operation can introduce delays into the flow of data, it should be avoided if possible.

One instance of the RK512 function block serves just one serial interface. It is not possible for multiple instances to handle data traffic over the same serial interface at the same time.

Input Parameters

Send	At a rising edge at the <i>Send</i> input data from the variable whose location is given by the <i>DbAdr</i> input is sent to the communication partner where it is saved in the data block whose number is given at <i>RemoteDbNr</i> . Send and fetch cannot be executed at the same time.
Fetch	With a rising edge at the <i>Fetch</i> input, data from the data block specified by <i>RemoteDbNr</i> is requested from the communication partner and saved in the variable specified by the <i>DbAdr</i> input. Send and fetch cannot be executed at the same time.
DbAdr	<i>DbAdr</i> is the memory address of a PLC variable determined by the ADR function.e.g.: <i>DbAdr := ADR(PLCvar);</i> The PLC variable can be of any type. An ARRAY OF WORD, for example, or a STRUCT data structure would be suitable.Data from this variable is transmitted to the communication partner with a send command, and is fetched and stored in this variable with a fetch command.
DbSize	<i>DbSize</i> is the size of the PLC variable at <i>DbAdr</i> in bytes, determined by the SIZEOF function.e.g.: <i>DbSize := SIZEOF(PLCvar);</i>
RemoteDbNr	<i>RemoteDbNr</i> contains the number of the data block at the communication partner to which the data is to be sent or from which it is to be fetched.
NrOfBytes	<i>NrOfBytes</i> contains the number of data bytes to be transferred. The number can be less than or equal to the variable size <i>DbSize</i> .
ByteOffset	The <i>ByteOffset</i> indicated the data byte within the communication partner's data block from where the data is to be fetched or where it is to be stored.
HighPriority	The priority is relevant to the 3964R protocol. The two communication partners should have different priorities. If it happens that the two partners transmit at the same time, there is a collision. This collision is resolved by the partner with the lower priority switching to receive mode, allowing the higher priority partner to transmit again.
SwapWords	Data blocks are usually organised by words. Depending on how the data words are stored in the memory, it may be necessary to swap data bytes within the transmitted words. If <i>SwapWords</i> is TRUE, the data bytes of each word in all the data telegrams are swapped.
TREA	Every telegram from a communication partner is acknowledged by an answer telegram. The time required for this acknowledgement is monitored with respect to the <i>TREA</i> timeout period. <i>TREA</i> might be about 15 seconds.

Output Parameters

Busy	<i>Busy</i> becomes TRUE as soon as the block switches into either active or passive mode, i.e. as soon as it leaves the idle state. It cannot accept a new command as long as <i>Busy</i> remains TRUE.
BusySendFetch	<i>BusySendFetch</i> becomes TRUE as soon as a rising edge at the <i>Send</i> or <i>Fetch</i> input switches the block into active mode. Once <i>BusySendFetch</i> has become FALSE the transmission has been completed, and either the <i>SendFetchSuccess</i> or the <i>Error</i> output is set.
SendFetchSuccess	<i>SendFetchSuccess</i> indicates that a data transfer triggered by <i>Send</i> or <i>Fetch</i> has been successfully completed.
Error	<i>Error</i> becomes TRUE if an error occurs during a data transfer triggered by <i>Send</i> or <i>Fetch</i> .
ErrorId	<i>ErrorId</i> provides an error number [► 72] if an error occurs.
BusyReceive	<i>BusyReceive</i> indicates that the RK512 function block is in receive mode, i.e. in the passive operating mode. The block changes automatically into passive mode from the idle state (<i>Busy</i> is FALSE) as soon as a telegram is received from the communication partner. As <i>BusyReceive</i> falls, either <i>ReceiveSuccess</i> or <i>ErrorRx</i> is set.
ReceiveSuccess	<i>ReceiveSuccess</i> is set to TRUE after a data block has been successfully received from the communication partner. This signal is only relevant to passive operation. In other words, <i>ReceiveSuccess</i> is not set to TRUE if a data block has been actively fetched from the communication partner with <i>Fetch</i> .
ReceivedDbNr	As soon as <i>ReceiveSuccess</i> becomes TRUE, <i>ReceivedDbNr</i> indicates the number of the data block that has been received.

ErrorRx	The <i>ErrorRx</i> signal indicates that an error has occurred during data reception in passive mode.
ErrorIdRx	If an error occurs in passive mode, ErrorIdRx indicates the <u>error number</u> [▶ 72].
Aux	Aux is a data structure containing additional error messages for diagnostic purposes.

In-/Output Parameters

TxBuffer	The transmit data buffer <i>TxBuffer</i> is of type COMbuffer. This buffer is used by the RK512 function block, and is not changed by the user.
RxBuffer	The receive data buffer <i>RxBuffer</i> is of type COMbuffer. This buffer is used by the RK512 function block, and is not changed by the user.

DBconfig()- Method for data block configuration

The RK512 function block has two operating modes. In passive mode it receives data and request telegrams from a communication partner who is addressing data blocks by means of its data block number. Numbered data blocks are not known to IEC-1131, and therefore initially also not to TwinCAT. In TwinCAT, data blocks are variables of various types such as arrays or data structures (STRUCT).

In order to define a numbered data block, the method DBconfig belonging to the RK512 function block as called with all the necessary parameters during the initialisation phase. The method is called once for each data block that is to be addressed by communication partners. This configuration is not needed for the active operating mode (send and fetch).

In the active operating mode variable contents can be sent to or fetched from communication partners, independently of this data block configuration. In active mode the data block number refers to the partner device, and only needs to be known there.

Parameters

DbAdr	<i>DbAdr</i> is the memory address of a PLC variable that is to be defined as a data block. The address is determined using the ADR function.e.g.: DbAdr := ADR(PLCvar);The PLC variable can be of any type. An ARRAY OF WORD, for example, or a STRUCT data structure would be suitable.
DbSize	DbSize is the size of the PLC variable at <i>DbAdr</i> in bytes, determined by the SIZEOF function.e.g.: DbSize := SIZEOF(PLCvar);
RemoteDbNr	RemoteDbNr contains the number of the data block at the communication partner.
TxBuffer	The transmit data buffer <i>TxBuffer</i> is of type COMbuffer. This parameter is not needed by the configuration, but must however be passed as an IN_OUT parameter.
RxBuffer	The receive data buffer <i>RxBuffer</i> is of type COMbuffer. This parameter is not needed by the configuration, but must however be passed as an IN_OUT parameter.

Example

5.2 Data Types

5.2.1 Structures

5.2.1.1 ComBuffer

The data structure **ComBuffer** is a data buffer for decoupling the hardware-dependent communication blocks from the hardware-independent blocks (see also [Communication concept](#) [▶ 33]). At the same time this decouples a fast communication task from the standard task. Data buffers of type ComBuffer are never directly written or read by the user, but are merely used as intermediate storage for the communication blocks.

5.2.1.3 ComSerialConfig

This input structure defines which COM port is to be used and opened with which parameters.

If a parameter is changed during cyclic calls of [SerialLineControlADS](#) [► 50], the existing COM port connection is closed automatically, and the serial COM port is opened with the new parameter. It is not necessary to close the port explicitly by resetting the input *Connect*.

ComPort	Any COM port (COM1 .. COM255) can be selected. The Windows hardware device manager indicates which number a driver (e.g. a USB-to-virtual-COM-port driver) has assigned.
Baud rate	All standard baud rates can be set, from 150 baud up to 128000 baud. The default is 9600 baud. 115200 baud is also a common transfer rate.
Parity	The parity check for the serial data transfer is set here. Possible values are summarized in the enumeration ComParity_t [► 62].
DataBits	The number of data bits for the serial data transfer is set here. Possible values are 4, 5, 6, 7 and 8. Although complete data bytes are still transferred to the PLC buffer if the value is smaller than 8 bits, not all 8 bits of a byte are transferred via the serial interface. The bits with the highest values are cut off before the transfer, which reduces the amount of bits per data byte to be transferred. This setting was useful in the past in cases where it was known that the bit with the highest value in each byte was never used and where data transfer rate was important. Nowadays it is rarely used, so that it is recommended to leave the number of data bits at 8 [default].
StopBits	The number of stop bits for the serial data transfer is set here. Possible values are summarized in the enumeration ComStopBits_t [► 62].
RTS	The 'Request to Send' signal (= RFR 'Ready for Receiving') for the serial data transfer is set here. Possible values are summarized in the enumeration ComRTSCtrl_t [► 62].
DTR	The 'Data Terminal Ready' signal for the serial data transfer is set here. Possible values are summarized in the enumeration ComDTRCtrl_t [► 62].

CTS The 'Clear to Send' signal for the serial data transfer is set here. If the value is TRUE, no data are sent if the CTS input signal for the data transfer is not set.

DSR The 'Dataset Ready' signal for the serial data transfer is set here. If the value is TRUE, no data are sent if the DSR input signal for the data transfer is not set. If *DSR* is TRUE, received data bytes are ignored, if the DSR input signal for the data transfer is not set.

TraceLevel This input can be used to configure messages (debug traces) that are issued by the TcAdsSerialCommServer.
This does not apply to the error messages at the output of the PLC function block SerialLineControlADS. It is therefore an additional diagnostic option.

The following trace levels are possible:

- None: 0 (default)
- Error: 1
- Warning: 2
- Info: 3
- Verbose: 4
- Noise: 5

All messages with a level less or equal the specified level are output. If level 'None' is selected, no messages are output.

Debug traces are used as output. Under Win32, error/warning/information messages are also output as log events (application log).

If level 'Noise' is selected, data received at the serial port are included in the message output. This option requires considerable system resources and should therefore only be selected for temporary testing purposes.

Note: If the DebugView tool (from SysInternals) is used, the setting CaptureGlobalWin32 must be active in order to receive the messages.

i Invalid parameterization

Not all parameter settings for serial data transfer may be available in all cases. Some settings or combinations are not supported by Windows or the COM port drivers.

Example: in some cases the 1.5 stop bits or the 4 data bits options, or the combination of 5 data bits & 2 stop bits are not supported. Or the baud rate may be limited to a maximum of 115200 baud.

Further information on the parameters for serial data transfer can be found in the Microsoft MSDN description of the DCB structure.

5.3 Global constants

5.3.1 Global_Version

All libraries have a certain version. The version is indicated in the PLC library repository, for example. A global constant of type ST_LibVersion contains the library version information:

```

VAR_GLOBAL CONSTANT
    stLibVersion_Tc2_SerialCom : ST_LibVersion;
END_VAR

```

To check whether the version you have is the version you need, use the function `F_CmpLibVersion` (defined in `Tc2_System` library).

All other options for comparing library versions, which you may know from TwinCAT 2, are out-dated!

6 Examples

The following examples were developed with different hardware.

Example 1 - Tutorial

The application of the library blocks is explained in the form of a [Tutorial \[▶ 20\]](#), including the sections 'Integration in a PLC program' and 'Configuration in the TwinCAT System Manager'. Reference is also made to the use of different hardware.

Project https://infosys.beckhoff.com/content/1033/TF6340_Tc3_Serial_Communication/Resources/zip/9007199646873611.zip

Example 3 - Application of virtual Com ports

This example can be used for different applications with virtual Com ports. Any data can be sent or received.

This is not really an example but a test program for testing the communication connection to the USB device. Nevertheless, as a first step it is advisable to use a Windows terminal program to test the functionality of the VirtualComPort driver of your device.

In an application that uses a virtual Com port only the call of [SerialLineControlADS \[▶ 50\]](#) is specific. The other serial communication calls, such as send and receive data, are identical to actual serial ports.

Linking in the TwinCAT System Manager is not required.

The example can be used for convenient commissioning and testing of the device. The example features a visualization.

7 Appendix

7.1 Error codes overview

Not for all function blocks of the PLC library Tc2_SerialComm return the same error codes.

Three functions blocks have own error lists.

The most function blocks return an error as [Error Codes ComError_t](#) [▶ 67].

The following three function blocks are an exception:

- **SerialLineControlADS**: The function block returns errors only from its [specific error list](#) [▶ 68].
- **P3964R**: The function block returns errors only from its [specific error list](#) [▶ 71].
- **RK512**: The function block returns errors only from its [specific error list](#) [▶ 72].

7.3 Error Codes SerialLineControlADS

Overview

Offset + error code	Range	Description
0x00000000 + TwinCAT system error [▶ 74]	0x00000000-0x00007800	TwinCAT system error (including ADS error codes)
0x00000000 + TcAdsSerialCommServer error	0x00009000-0x000091FF	Error in the TwinCAT ADS Serial Comm Server
0x3D090000 + Win32 System Error Code [▶ 77]	0x3D090000-0x3D09FFFF	Win32 system error

Error codes of the type *ComError_t* are not used by this function block.

● Debugging

For more detailed error analysis additional debug outputs can be configured in the *TcAdsSerialCommServer*. Use the variable *Trace Level* in the input structure [SerialCfg](#) [[▶ 58](#)] for this purpose.

additional information on the most important TwinCAT system errors

Code (hex)	Code (dec)	Description	Additional information
0x00000006	6	The system cannot find the destination port. ADS Server may not have started.	The TwinCAT function, including ADS server, must be installed on the system on which the virtual COM port is located.

Additional information regarding the main Win32 system errors

Code (hex)	Code (dec)	Description	Additional information	Symbolic name
0x3D090002	1024000002	The system cannot find the specified file.	This error can occur if the specified COM port is not available. Make sure the value for the COM port and the other parameters in ComSerialConfig [▶ 58] are specified correctly.	ERROR_FILE_NOT_FOUND
0x3D090005	1024000005	Access is denied.	Check whether the respective serial COM port was already accessed/opened by another program. In this case you have to enable the port from the other program, in order to enable communication.	ERROR_ACCESS_DENIED
0x3D090057	1024000087	The parameter is incorrect.	This error occurs if an input parameter for serial data communication is invalid (see ComSerialConfig [▶ 58]). Not all parameter settings for serial data communication may be available in all cases. Some settings or combinations are not supported by Windows or the COM port drivers. In this case you should check whether the communication works with a different parameter setting.	ERROR_INVALID_PARAMETER

7.4 Error Codes 3964R

Code (dec)	Code (hex)	Error constant	Description
4	16#04	P3964ERR_ZVZ	The character delay time was exceeded. ZVZ = 220 ms. The character delay time is the maximum time interval between the transmission of two succeeding characters.
5	16#05	P3964ERR_QVZ	The acknowledgement delay time was exceeded. The other end sent an acknowledgement character (DLE = 10H) twice as the telegram was being handled. ADT = 2 sec. The first acknowledgement is expected at the start of the transfer. The output <i>ErrorState</i> when an error initially occurs is "Wait_DLE_TXstart". The cause might lie with a faulty physical connection or an incorrect interface parameter. The second acknowledgement is expected after the user data has been transmitted. If an error occurs, the <i>ErrorState</i> is "Wait_DLE_TXend". In this case the cause might, for instance, be data loss, data corruption or data bytes of a data word that have become swapped (see the <i>SwapWords</i> input).
6	16#06	P3964ERR_WVZ	The repeat delay time was exceeded. RDT = 4 sec. In the event of an error a telegram is repeated. If the telegram is not repeated by the other device, the 3964R function block reports this error.
7	16#07	P3964ERR_WRONGB CC	Checksum error during data reception. Each telegram is provided with a checksum. When the data is received, the calculated checksum is compared with the checksum that has been received.
9	16#09	P3964ERR_COMERRT X	Interface error when transmitting.
10	16#0A	P3964ERR_COMERR RX	Interface error when receiving.
11	16#0B	P3964ERR_NOTXDAT A	Parameterization error. The number of bytes that are to be sent, <i>TxCount</i> , is zero.
20	16#14	P3964ERR_NAK	A telegram was refused by the other device with a negative acknowledgement (NAK). This error can occur in the following transmission states (<i>ErrorState</i>), amongst others: The local PLC begins a telegram with a start character. The remote terminal rejects the telegram with NAK. <i>Wait_DLE_TXend</i> : The other device refuses the telegram with NAK after the user data has been transmitted. In this case the cause can, for example, be a checksum error at the other device.

7.5 Error Codes RK512

Code (dec)	Code (hex)	Error constant	Description
4	16#04	RK512ERR_P3964ERR_ZVZ	The character delay time was exceeded. ZVZ = 220 ms. The character delay time is the maximum time interval between the transmission of two succeeding characters.
5	16#05	RK512ERR_P3964ERR_QVZ	The acknowledgement delay time was exceeded. The other end sent an acknowledgement character (DLE = 10H) twice as the telegram was being handled. ADT = 2 sec. The first acknowledgement is expected at the start of the transfer. The output <i>ErrorState</i> when an error initially occurs is "Wait_DLE_TXstart". The cause might lie with a faulty physical connection or an incorrect interface parameter. The second acknowledgement is expected after the user data has been transmitted. If an error occurs, the <i>ErrorState</i> is "Wait_DLE_TXend". In this case the cause might, for instance, be data loss, data corruption or data bytes of a data word that have become swapped (see the <i>SwapWords</i> input).
6	16#06	RK512ERR_P3964ERR_WVZ	The repeat delay time was exceeded. RDT = 4 sec. In the event of an error a telegram is repeated. If the telegram is not repeated by the other device, the 3964R function block reports this error.
7	16#07	RK512ERR_P3964ERR_WRO NGBCC	Checksum error during data reception. Each telegram is provided with a checksum. When the data is received, the calculated checksum is compared with the checksum that has been received.
9	16#09	RK512ERR_P3964ERR_COM ERRTX	Interface error when transmitting.
10	16#0A	RK512ERR_P3964ERR_COM ERRRX	Interface error when receiving.
11	16#0B	RK512ERR_P3964ERR_NOTX DATA	Parameterization error. The number of bytes that are to be sent, <i>TxCount</i> , is zero.
120	16#78	RK512ERR_P3964ERR_NAK	A telegram was refused by the other device with a negative acknowledgement (NAK). This error can occur in the following transmission states (<i>ErrorState</i>), amongst others: The local PLC begins a telegram with a start character. The remote terminal rejects the telegram with NAK. <i>Wait_DLE_TXend</i> : The other device refuses the telegram with NAK after the user data has been transmitted. In this case the cause can, for example, be a checksum error at the other device.
12	16#0C	RK512ERR_INVALIDDATATY PE	Invalid data type A telegram with unsupported data type ID was received. Only data blocks with the identifier 'D' can be handled.
16	16#10	RK512ERR_ERRORPROTOL HEADER	Wrong protocol header The header of a data telegram does not match the RK512 specification
20	16#14	RK512ERR_DBNOTAVAILIBL E	Data block not available A data block that is not available has been transmitted or requested. Data blocks that are accessed by the partner device must first be registered for this purpose with the DBconfig method.

Code (dec)	Code (hex)	Error constant	Description
22	16#16	RK512ERR_INVALIDCOMMAN D	Invalid command A telegram with invalid command ID (SEND / FETCH) was received.
52	16#34	RK512ERR_INVALIDSIZE	Either the <i>DbSize</i> or the <i>NrOfBytes</i> parameter is invalid, or a data telegram that is too long has been received.
53	16#35	RK512ERR_INVALIDDBADR	Invalid data block address The data block address <i>DbAdr</i> is invalid.
54	16#36	RK512ERR_SYNCERROR	Synchronization error A can occur if both communication partners start to transmit at the same time.
257	16#101	RK512ERR_TIMEOUT	Timeout at RK512 telegram level An expected response telegram was not received within the waiting time <i>TREA</i> .
258	16#102	RK512ERR_ERRORREMOTE REATEL	Error in the response telegram The response telegram from the communication partner contains an error message. The error number can be read from the additional error information in <i>AUX</i> .
259	16#103	RK512ERR_INVALIDSIZEREM OTEREATEL	The communication partner's reaction telegram has an incorrect length.
260	16#104	RK512ERR_TIMEOUTTREAPE ATSENFETCH	Timeout during sending A Send or Fetch telegram could not be sent, despite several attempts.
261	16#105	RK512ERR_3964ERROR	Error on the 3964R protocol level Predictable errors on this level are not reported as a general RK512ERR_3964ERROR error, but with a detailed error number.
262	16#106	RK512ERR_3964NOTBUSYN OTREADY	The transmission of a telegram has been halted without having been successfully completed.

7.6 ADS Return Codes

Error codes: [0x000 \[▶ 74\]...](#), [0x500 \[▶ 75\]...](#), [0x700 \[▶ 75\]...](#), [0x1000 \[▶ 76\]...](#)

HRESULT

When output in HRESULT format, the ADS return codes are preceded by the high word 16#9811. The error 'Destination port not found' is then output as 16#9811_0006, for example.

Global Error Codes

Hex	Dec	Description
0x0	0	no error
0x1	1	Internal error
0x2	2	No Rtime
0x3	3	Allocation locked memory error
0x4	4	Insert mailbox error
0x5	5	Wrong receive HMSG
0x6	6	target port not found
0x7	7	target machine not found

Hex	Dec	Description
0x8	8	Unknown command ID
0x9	9	Bad task ID
0xA	10	No IO
0xB	11	Unknown ADS command
0xC	12	Win 32 error
0xD	13	Port not connected
0xE	14	Invalid ADS length
0xF	15	Invalid AMS Net ID
0x10	16	Low Installation level
0x11	17	No debug available
0x12	18	Port disabled
0x13	19	Port already connected
0x14	20	ADS Sync Win32 error
0x15	21	ADS Sync Timeout
0x16	22	ADS Sync AMS error
0x17	23	ADS Sync no index map
0x18	24	Invalid ADS port
0x19	25	No memory
0x1A	26	TCP send error
0x1B	27	Host unreachable
0x1C	28	Invalid AMS fragment

Router Error Codes

Hex	Dec	Name	Description
0x500	1280	ROUTERERR_NOLOCKEDMEMORY	No locked memory can be allocated
0x501	1281	ROUTERERR_RESIZEMEMORY	The size of the router memory could not be changed
0x502	1282	ROUTERERR_MAILBOXFULL	The mailbox has reached the maximum number of possible messages. The current sent message was rejected
0x503	1283	ROUTERERR_DEBUGBOXFULL	The mailbox has reached the maximum number of possible messages. The sent message will not be displayed in the debug monitor
0x504	1284	ROUTERERR_UNKNOWNPORTTYPE	Unknown port type
0x505	1285	ROUTERERR_NOTINITIALIZED	Router is not initialized
0x506	1286	ROUTERERR_PORTALREADYINUSE	The desired port number is already assigned
0x507	1287	ROUTERERR_NOTREGISTERED	Port not registered
0x508	1288	ROUTERERR_NOMOREQUEUEUS	The maximum number of Ports reached
0x509	1289	ROUTERERR_INVALIDPORT	Invalid port
0x50A	1290	ROUTERERR_NOTACTIVATED	TwinCAT Router not active

General ADS Error Codes

Hex	Dec	Name	Description
0x700	1792	ADSERR_DEVICE_ERROR	General device error
0x701	1793	ADSERR_DEVICE_SRVNOTSUPP	Service is not supported by server
0x702	1794	ADSERR_DEVICE_INVALIDGRP	invalid index group
0x703	1795	ADSERR_DEVICE_INVALIDOFFSET	invalid index offset
0x704	1796	ADSERR_DEVICE_INVALIDACCESS	reading/writing not permitted
0x705	1797	ADSERR_DEVICE_INVALIDSIZE	parameter size not correct
0x706	1798	ADSERR_DEVICE_INVALIDDATA	invalid parameter value(s)
0x707	1799	ADSERR_DEVICE_NOTREADY	device is not in a ready state
0x708	1800	ADSERR_DEVICE_BUSY	device is busy
0x709	1801	ADSERR_DEVICE_INVALIDCONTEXT	invalid context (must be in Windows)
0x70A	1802	ADSERR_DEVICE_NOMEMORY	out of memory
0x70B	1803	ADSERR_DEVICE_INVALIDPARM	invalid parameter value(s)
0x70C	1804	ADSERR_DEVICE_NOTFOUND	not found (files, ...)
0x70D	1805	ADSERR_DEVICE_SYNTAX	syntax error in command or file
0x70E	1806	ADSERR_DEVICE_INCOMPATIBLE	objects do not match
0x70F	1807	ADSERR_DEVICE_EXISTS	object already exists

Hex	Dec	Name	Description
0x710	1808	ADSERR_DEVICE_SYMBOLNOTFOUND	symbol not found
0x711	1809	ADSERR_DEVICE_SYMBOLVERSIONINVAL	symbol version invalid
0x712	1810	ADSERR_DEVICE_INVALIDSTATE	server is in invalid state
0x713	1811	ADSERR_DEVICE_TRANSMODENOTSUPP	AdsTransMode not supported
0x714	1812	ADSERR_DEVICE_NOTIFYHNDINVALID	Notification handle is invalid
0x715	1813	ADSERR_DEVICE_CLIENTUNKNOWN	Notification client not registered
0x716	1814	ADSERR_DEVICE_NOMOREHDLS	no more notification handles
0x717	1815	ADSERR_DEVICE_INVALIDWATCHSIZE	size for watch too big
0x718	1816	ADSERR_DEVICE_NOTINIT	device not initialized
0x719	1817	ADSERR_DEVICE_TIMEOUT	device has a timeout
0x71A	1818	ADSERR_DEVICE_NOINTERFACE	query interface failed
0x71B	1819	ADSERR_DEVICE_INVALIDINTERFACE	wrong interface required
0x71C	1820	ADSERR_DEVICE_INVALIDCLSID	class ID is invalid
0x71D	1821	ADSERR_DEVICE_INVALIDOBJID	object ID is invalid
0x71E	1822	ADSERR_DEVICE_PENDING	request is pending
0x71F	1823	ADSERR_DEVICE_ABORTED	request is aborted
0x720	1824	ADSERR_DEVICE_WARNING	signal warning
0x721	1825	ADSERR_DEVICE_INVALIDARRAYIDX	invalid array index
0x722	1826	ADSERR_DEVICE_SYMBOLNOTACTIVE	symbol not active
0x723	1827	ADSERR_DEVICE_ACCESSDENIED	access denied
0x724	1828	ADSERR_DEVICE_LICENSENOTFOUND	missing license
0x725	1829	ADSERR_DEVICE_LICENSEEXPIRED	license expired
0x726	1830	ADSERR_DEVICE_LICENSEEXCEEDED	license exceeded
0x727	1831	ADSERR_DEVICE_LICENSEINVALID	license invalid
0x728	1832	ADSERR_DEVICE_LICENSESYSTEMID	license invalid system id
0x729	1833	ADSERR_DEVICE_LICENSENOTIMELIMIT	license not time limited
0x72A	1834	ADSERR_DEVICE_LICENSEFUTUREISSUE	license issue time in the future
0x72B	1835	ADSERR_DEVICE_LICENSETIMETOLONG	license time period to long
0x72c	1836	ADSERR_DEVICE_EXCEPTION	exception occurred during system start
0x72D	1837	ADSERR_DEVICE_LICENSEDUPLICATED	License file read twice
0x72E	1838	ADSERR_DEVICE_SIGNATUREINVALID	invalid signature
0x72F	1839	ADSERR_DEVICE_CERTIFICATEINVALID	public key certificate
0x740	1856	ADSERR_CLIENT_ERROR	Error class <client error>
0x741	1857	ADSERR_CLIENT_INVALIDPARM	invalid parameter at service
0x742	1858	ADSERR_CLIENT_LISTEMPTY	polling list is empty
0x743	1859	ADSERR_CLIENT_VARUSED	var connection already in use
0x744	1860	ADSERR_CLIENT_DUPLINVOKEID	invoke ID in use
0x745	1861	ADSERR_CLIENT_SYNC TIMEOUT	timeout elapsed
0x746	1862	ADSERR_CLIENT_W32ERROR	error in win32 subsystem
0x747	1863	ADSERR_CLIENT_TIMEOUTINVALID	Invalid client timeout value
0x748	1864	ADSERR_CLIENT_PORTNOTOPEN	ads-port not opened
0x750	1872	ADSERR_CLIENT_NOAMSADDR	internal error in ads sync
0x751	1873	ADSERR_CLIENT_SYNCINTERNAL	hash table overflow
0x752	1874	ADSERR_CLIENT_ADDHASH	key not found in hash
0x753	1875	ADSERR_CLIENT_REMOVEHASH	no more symbols in cache
0x754	1876	ADSERR_CLIENT_NOMORESVM	invalid response received
0x755	1877	ADSERR_CLIENT_SYNCRESINVALID	sync port is locked

RTime Error Codes

Hex	Dec	Name	Description
0x1000	4096	RTERR_INTERNAL	Internal fatal error in the TwinCAT real-time system
0x1001	4097	RTERR_BADTIMERPERIODS	Timer value not valid
0x1002	4098	RTERR_INVALIDTASKPTR	Task pointer has the invalid value ZERO
0x1003	4099	RTERR_INVALIDSTACKPTR	Task stack pointer has the invalid value ZERO
0x1004	4100	RTERR_PRIOEXISTS	The demand task priority is already assigned

Hex	Dec	Name	Description
0x1005	4101	RTERR_NOMORETCB	No more free TCB (Task Control Block) available. Maximum number of TCBs is 64
0x1006	4102	RTERR_NOMORESEMAS	No more free semaphores available. Maximum number of semaphores is 64
0x1007	4103	RTERR_NOMOREQUEUES	No more free queue available. Maximum number of queue is 64
0x100D	4109	RTERR_EXTIRQALREADYDEF	An external synchronization interrupt is already applied
0x100E	4110	RTERR_EXTIRQNOTDEF	No external synchronization interrupt applied
0x100F	4111	RTERR_EXTIRQINSTALLFAILED	The apply of the external synchronization interrupt failed
0x1010	4112	RTERR_IRQNOTLESSOREQUAL	Call of a service function in the wrong context
0x1017	4119	RTERR_VMXNOTSUPPORTED	Intel VT-x extension is not supported
0x1018	4120	RTERR_VMXDISABLED	Intel VT-x extension is not enabled in system BIOS
0x1019	4121	RTERR_VMXCONTROLSMISSING	Missing function in Intel VT-x extension
0x101A	4122	RTERR_VMXENABLEFAILS	Enabling Intel VT-x fails

TCP Winsock Error Codes

Hex	Dec	Description
0x274D	10061	A connection attempt failed because the connected party did not properly respond after a period of time, or established connection failed because connected host has failed to respond.
0x2751	10065	No connection could be made because the target machine actively refused it. This error normally occurs when you try to connect to a service which is inactive on a different host - a service without a server application.
0x274C	10060	No route to a host. A socket operation was attempted to an unreachable host

0 [▶ 77], 100 [▶ 79], 200 [▶ 81], 1001 [▶ 82], 1100 [▶ 84], 1200 [▶ 86], 1400 [▶ 90], 1600 [▶ 92], 1800 [▶ 96], 2000 [▶ 97], 3000 [▶ 98], 5000 [▶ 100], 6000 [▶ 103], 8000 [▶ 105], 8500 [▶ 113], 9001 [▶ 117], 10004 [▶ 118], 12000 [▶ 121],

Error			Description
decimal	Hexadecimal	Name	
0	0x00000000	ERROR_SUCCESS	The operation completed successfully.
1	0x00000001	ERROR_INVALID_FUNCTION	Incorrect function.
2	0x00000002	ERROR_FILE_NOT_FOUND	The system cannot find the file specified.
3	0x00000003	ERROR_PATH_NOT_FOUND	The system cannot find the path specified.
4	0x00000004	ERROR_TOO_MANY_OPEN_FILES	The system cannot open the file.
5	0x00000005	ERROR_ACCESS_DENIED	Access is denied.
6	0x00000006	ERROR_INVALID_HANDLE	The handle is invalid.
7	0x00000007	ERROR_ARENA_TRASHED	The storage control blocks were destroyed.
8	0x00000008	ERROR_NOT_ENOUGH_MEMORY	Not enough storage is available to process this command.
9	0x00000009	ERROR_INVALID_BLOCK	The storage control block address is invalid.
10	0x0000000A	ERROR_BAD_ENVIRONMENT	The environment is incorrect.
11	0x0000000B	ERROR_BAD_FORMAT	An attempt was made to load a program with an incorrect format.
12	0x0000000C	ERROR_INVALID_ACCESS	The access code is invalid.
13	0x0000000D	ERROR_INVALID_DATA	The data is invalid.
14	0x0000000E	ERROR_OUTOFMEMORY	Not enough storage is available to complete this operation.
15	0x0000000F	ERROR_INVALID_DRIVE	The system cannot find the drive specified.
16	0x00000010	ERROR_CURRENT_DIRECTORY	The directory cannot be removed.
17	0x00000011	ERROR_NOT_SAME_DEVICE	The system cannot move the file to a different disk drive.
18	0x00000012	ERROR_NO_MORE_FILES	There are no more files.
19	0x00000013	ERROR_WRITE_PROTECT	The media is write protected.

		Error	Description
decimal	Hexadecimal	Name	
20	0x00000014	ERROR_BAD_UNIT	The system cannot find the device specified.
21	0x00000015	ERROR_NOT_READY	The device is not ready.
22	0x00000016	ERROR_BAD_COMMAND	The device does not recognize the command.
23	0x00000017	ERROR_CRC	Data error (cyclic redundancy check).
24	0x00000018	ERROR_BAD_LENGTH	The program issued a command but the command length is incorrect.
25	0x00000019	ERROR_SEEK	The drive cannot locate a specific area or track on the disk.
26	0x0000001A	ERROR_NOT_DOS_DISK	The specified disk or diskette cannot be accessed.
27	0x0000001B	ERROR_SECTOR_NOT_FOUND	The drive cannot find the sector requested.
28	0x0000001C	ERROR_OUT_OF_PAPER	The printer is out of paper.
29	0x0000001D	ERROR_WRITE_FAULT	The system cannot write to the specified device.
30	0x0000001E	ERROR_READ_FAULT	The system cannot read from the specified device.
31	0x0000001F	ERROR_GEN_FAILURE	A device attached to the system is not functioning.
32	0x00000020	ERROR_SHARING_VIOLATION	The process cannot access the file because it is being used by another process.
33	0x00000021	ERROR_LOCK_VIOLATION	The process cannot access the file because another process has locked a portion of the file.
34	0x00000022	ERROR_WRONG_DISK	The wrong diskette is in the drive. Insert %2 (Volume Serial Number: %3) into drive %1.
36	0x00000024	ERROR_SHARING_BUFFER_EXCEEDED	Too many files opened for sharing.
38	0x00000026	ERROR_HANDLE_EOF	Reached the end of the file.
39	0x00000027	ERROR_HANDLE_DISK_FULL	The disk is full.
50	0x00000032	ERROR_NOT_SUPPORTED	The request is not supported.
51	0x00000033	ERROR_REM_NOT_LIST	The remote computer is not available.
52	0x00000034	ERROR_DUP_NAME	A duplicate name exists on the network.
53	0x00000035	ERROR_BAD_NETPATH	The network path was not found.
54	0x00000036	ERROR_NETWORK_BUSY	The network is busy.
55	0x00000037	ERROR_DEV_NOT_EXIST	The specified network resource or device is no longer available.
56	0x00000038	ERROR_TOO_MANY_CMDS	The network BIOS command limit has been reached.
57	0x00000039	ERROR_ADAP_HDW_ERR	A network adapter hardware error occurred.
58	0x0000003A	ERROR_BAD_NET_RESP	The specified server cannot perform the requested operation.
59	0x0000003B	ERROR_UNEXP_NET_ERR	An unexpected network error occurred.
60	0x0000003C	ERROR_BAD_REM_ADAP	The remote adapter is not compatible.
61	0x0000003D	ERROR_PRINTQ_FULL	The printer queue is full.
62	0x0000003E	ERROR_NO_SPOOL_SPACE	Space to store the file waiting to be printed is not available on the server.
63	0x0000003F	ERROR_PRINT_CANCELLED	Your file waiting to be printed was deleted.
64	0x00000040	ERROR_NETNAME_DELETED	The specified network name is no longer available.
65	0x00000041	ERROR_NETWORK_ACCESS_DENIED	Network access is denied.
66	0x00000042	ERROR_BAD_DEV_TYPE	The network resource type is not correct.
67	0x00000043	ERROR_BAD_NET_NAME	The network name cannot be found.
68	0x00000044	ERROR_TOO_MANY_NAMES	The name limit for the local computer network adapter card was exceeded.
69	0x00000045	ERROR_TOO_MANY_SESS	The network BIOS session limit was exceeded.
70	0x00000046	ERROR_SHARING_PAUSED	The remote server has been paused or is in the process of being started.
71	0x00000047	ERROR_REQ_NOT_ACCEP	No more connections can be made to this remote computer at this time because there are already as many connections as the computer can accept.
72	0x00000048	ERROR_REDIR_PAUSED	The specified printer or disk device has been paused.
80	0x00000050	ERROR_FILE_EXISTS	The file exists.
82	0x00000052	ERROR_CANNOT_MAKE	The directory or file cannot be created.

Error			Description
decimal	Hexadecimal	Name	
83	0x00000053	ERROR_FAIL_I24	Fail on INT 24.
84	0x00000054	ERROR_OUT_OF_STRUCTURES	Storage to process this request is not available.
85	0x00000055	ERROR_ALREADY_ASSIGNED	The local device name is already in use.
86	0x00000056	ERROR_INVALID_PASSWORD	The specified network password is not correct.
87	0x00000057	ERROR_INVALID_PARAMETER	The parameter is incorrect.
88	0x00000058	ERROR_NET_WRITE_FAULT	A write fault occurred on the network.
89	0x00000059	ERROR_NO_PROC_SLOTS	The system cannot start another process at this time.

Error			Description
decimal	Hexadecimal	Name	
100	0x00000064	ERROR_TOO_MANY_SEMAPHORES	Cannot create another system semaphore.
101	0x00000065	ERROR_EXCL_SEM_ALREADY_OWNED	The exclusive semaphore is owned by another process.
102	0x00000066	ERROR_SEM_IS_SET	The semaphore is set and cannot be closed.
103	0x00000067	ERROR_TOO_MANY_SEM_REQUESTS	The semaphore cannot be set again.
104	0x00000068	ERROR_INVALID_AT_INTERRUPT_TIME	Cannot request exclusive semaphores at interrupt time.
105	0x00000069	ERROR_SEM_OWNER_DIED	The previous ownership of this semaphore has ended.
106	0x0000006A	ERROR_SEM_USER_LIMIT	Insert the diskette for drive %1.
107	0x0000006B	ERROR_DISK_CHANGE	The program stopped because an alternate diskette was not inserted.
108	0x0000006C	ERROR_DRIVE_LOCKED	The disk is in use or locked by another process.
109	0x0000006D	ERROR_BROKEN_PIPE	The pipe has been ended.
110	0x0000006E	ERROR_OPEN_FAILED	The system cannot open the device or file specified.
111	0x0000006F	ERROR_BUFFER_OVERFLOW	The file name is too long.
112	0x00000070	ERROR_DISK_FULL	There is not enough space on the disk.
113	0x00000071	ERROR_NO_MORE_SEARCH_HANDLES	No more internal file identifiers available.
114	0x00000072	ERROR_INVALID_TARGET_HANDLE	The target internal file identifier is incorrect.
117	0x00000075	ERROR_INVALID_CATEGORY	The IOCTL call made by the application program is not correct.
118	0x00000076	ERROR_INVALID_VERIFY_SWITCH	The verify-on-write switch parameter value is not correct.
119	0x00000077	ERROR_BAD_DRIVER_LEVEL	The system does not support the command requested.

10004	0x00002714	WSAEINTR	A blocking operation was interrupted by a call to WSACancelBlockingCall.
10009	0x00002719	WSAEBADF	The file handle supplied is not valid.
10013	0x0000271D	WSAEACCES	An attempt was made to access a socket in a way forbidden by its access permissions.
10014	0x0000271E	WSAEFAULT	The system detected an invalid pointer address in attempting to use a pointer argument in a call.
10022	0x00002726	WSAEINVAL	An invalid argument was supplied.
10024	0x00002728	WSAEMFILE	Too many open sockets.
10035	0x00002733	WSAEWOULDBLOCK	A non-blocking socket operation could not be completed immediately.
10036	0x00002734	WSAEINPROGRESS	A blocking operation is currently executing.
10037	0x00002735	WSAEALREADY	An operation was attempted on a non-blocking socket that already had an operation in progress.

		Error		Description
decimal	Hexadecimal	Name		
10038	0x00002736	WSAENOTSOCK		An operation was attempted on something that is not a socket.
10039	0x00002737	WSAEDESTADDRREQ		A required address was omitted from an operation on a socket.
10040	0x00002738	WSAEMSGSIZE		A message sent on a datagram socket was larger than the internal message buffer or some other network limit, or the buffer used to receive a datagram into was smaller than the datagram itself.
10041	0x00002739	WSAEPROTOTYPE		A protocol was specified in the socket function call that does not support the semantics of the socket type requested.
10042	0x0000273A	WSAENOPROTOOPT		An unknown, invalid, or unsupported option or level was specified in a getsockopt or setsockopt call.
10043	0x0000273B	WSAEPROTONOSUPPORT		The requested protocol has not been configured into the system, or no implementation for it exists.
10044	0x0000273C	WSAESOCKTNOSUPPORT		The support for the specified socket type does not exist in this address family.
10045	0x0000273D	WSAEOPNOTSUPP		The attempted operation is not supported for the type of object referenced.
10046	0x0000273E	WSAEPFNOSUPPORT		The protocol family has not been configured into the system or no implementation for it exists.
10047	0x0000273F	WSAEAFNOSUPPORT		An address incompatible with the requested protocol was used.
10048	0x00002740	WSAEADDRINUSE		Only one usage of each socket address (protocol/network address/port) is normally permitted.
10049	0x00002741	WSAEADDRNOTAVAIL		The requested address is not valid in its context.
10050	0x00002742	WSAENETDOWN		A socket operation encountered a dead network.
10051	0x00002743	WSAENETUNREACH		A socket operation was attempted to an unreachable network.
10052	0x00002744	WSAENETRESET		The connection has been broken due to keep-alive activity detecting a failure while the operation was in progress.
10053	0x00002745	WSAECONNABORTED		An established connection was aborted by the software in your host machine.
10054	0x00002746	WSAECONNRESET		An existing connection was forcibly closed by the remote host.
10055	0x00002747	WSAENOBUFS		An operation on a socket could not be performed because the system lacked sufficient buffer space or because a queue was full.
10056	0x00002748	WSAEISCONN		A connect request was made on an already connected socket.
10057	0x00002749	WSAENOTCONN		A request to send or receive data was disallowed because the socket is not connected and (when sending on a datagram socket using a sendto call) no address was supplied.
10058	0x0000274A	WSAESHUTDOWN		A request to send or receive data was disallowed because the socket had already been shut down in that direction with a previous shutdown call.
10059	0x0000274B	WSAETOOMANYREFS		Too many references to some kernel object.
10060	0x0000274C	WSAETIMEDOUT		A connection attempt failed because the connected party did not properly respond after a period of time, or established connection failed because connected host has failed to respond.
10061	0x0000274D	WSAECONNREFUSED		No connection could be made because the target machine actively refused it.
10062	0x0000274E	WSAELOOP		Cannot translate name.
10063	0x0000274F	WSAENAMETOOLONG		Name component or name was too long.
10064	0x00002750	WSAEHOSTDOWN		A socket operation failed because the destination host was down.
10065	0x00002751	WSAEHOSTUNREACH		A socket operation was attempted to an unreachable host.
10066	0x00002752	WSAENOTEMPTY		Cannot remove a directory that is not empty.
10067	0x00002753	WSAEPROCLIM		A Windows Sockets implementation may have a limit on the number of applications that may use it simultaneously.
