# **GN**IIS CE

# **Model Number**

# OBE2000-R2-SE2

Thru-beam sensor with 2 m fixed cable

# **Features**

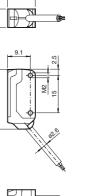

- Ultra-small housing design ٠
- 45° cable outlet for maximum moun-٠ ting freedom under extremely tight space constraints
- Improvement in machine availability • with abrasion-resistant, antistatic glass front
- Extremely large detection range in ٠ Long Range Mode
- Option of switching to high precision mode for greater switching accuracy

# **Product information**

The nano sensor has been developed for a broad range of applications. It offers excellent durability and is exceptionally easy to install. The housing is compact and, with its 45° cable outlet, can be installed in the smallest spaces. New functional principles and functionality open up a range of new options. The abrasion-resistant lens allows long operating times close to the moving object.

## **Teach-In Methods**

The thru-beam sensor enables the switching points to be taught in for optimum adaptation to specific applications. This eliminates the need for additional components such as apertures.

Essentially, all Teach-in methods can be used in both "High Precision" and "High Power" operating modes.

The sensitivity of the thru-beam sensor can be adjusted using three Teach-in methods:

## **Position Teach**

When using this Teach-in method, the following settings are made on the thru-beam sensor:

• The gain is set to an optimum value

Pepperl+Fuchs Group

www.pepperl-fuchs.com

• The signal threshold is set to a minimum

Date of issue: 2017-07-17 225909\_eng.xml Release date: 2017-07-17 13:39

PEPPERL+FUCHS

Germany: +49 621 776 4411 fa-info@de.pepperl-fuchs.com

## Recommended application:

This method enables extremely small differences in contrast to be detected, as well as minuscule particles in the beam path, and provides exceptional positioning accuracy.

The best results are achieved in "High Precision" mode.

- 1. Make sure that there are no objects in the beam path and that the sensor is connected to the power supply.
- 2. Connect the white cable on the receiver (WH/IN) to the blue cable (BU/0 V) on the receiver.
- The green and yellow LED indicators flash simultaneously at 2.5 Hz
- 3. Disconnect the white cable on the receiver (WH/IN) from the blue cable (BU/0 V) on the receiver. The green and yellow LED indicators flash alternately at 2.5 Hz
- 4. The end of the Teach-in process is indicated when the green LED indicator lights up sold and yellow LED blinks.

## **Two-Point Teach-In**

When using this Teach-in method, the following settings are made on the thru-beam sensor:

- The gain is set to an optimum value
- · The signal threshold is set in the center between the two taught signal values

Signal s	strength		_
Max	-		
	Teach-in value 1 (avg)	r T	
	Threshold level > Contrast le	levels	
	Teach-in value 2 (avg)		ļ
0 -	t t	►	

Recommended application:

Enables detection of transparent objects.

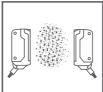

The best results are achieved in "High Precision" mode.

- 1. Make sure that there are no objects in the beam path and that the sensor is connected to the power supply.
- 2. Connect the white cable on the receiver (WH/IN) to the blue cable (BU/0 V) on the receiver. The green and yellow LED indicators flash simultaneously at 2.5 Hz
- 3. Position the object in the beam path.
- 4. Disconnect the white cable on the receiver (WH/IN) from the blue cable (BU/0 V) on the receiver. The green and yellow LED indicators flash alternately at 2.5 Hz
- 5. The end of the Teach-in process is indicated when the green LED indicator lights up sold.

## Maximum Teach-In

- When using this Teach-in method, the following settings are made on the thru-beam sensor:
- · The gain is set to a maximum
- · The signal threshold is set to a minimum

Signal strength		-	
Max			
			1
	Threshold level		
0			_

### Recommended application:

Enables an object to be detected with a high excess gain. This can be useful if there is severe environmental contamination or to achieve long operating times.

The best results are achieved in "High Precision" mode.

- 1. Make sure that there are no objects in the beam path and that the sensor is connected to the power supply.
- 2. Cover the receiver or transmitter.
- 3. Connect the white cable on the receiver (WH/IN) to the blue cable (BU/0 V) on the receiver. The green and yellow LED indicators flash simultaneously at 2.5 Hz
- 4 Disconnect the white cable on the receiver (WH/IN) from the blue cable (BU/0 V) on the receiver. The green and yellow LED indicators flash alternately at 2.5 Hz
- 5. The end of the Teach-in process is indicated when the green LED indicator lights up sold.
