Light grid

with fixed cable with 4-pin, M12 x 1 connector, and fixed cable with 8-pin, M12 x 1, connector

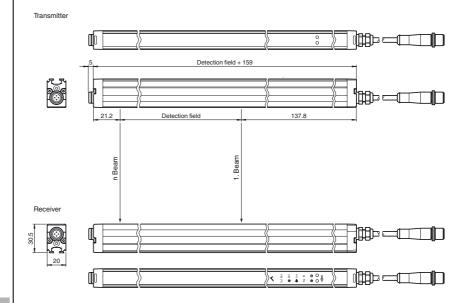

Features

- Measuring automation light grid with switching output
- Optical resolution 8 mm
- Super-fast object detection, even with 3-way beam crossover
- Object identification using integrated object recognition
- IO-link interface for service and process data
- Temperature range to -30 °C
- Output of a measured value, can be selected from a number of measuring functions

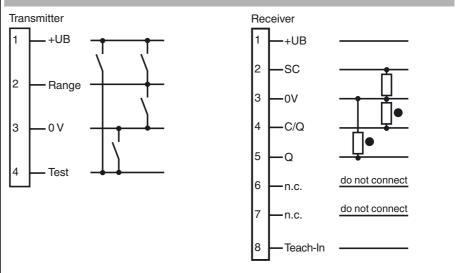

Product information

Automation light grids in the LGM Series are designed to measure small to large objects. The slimline light grids are modular in design and are available with various beam gaps and field heights. The entire signal evaluation process is carried out within the device. The lightweight systems can be integrated elegantly into their surroundings, from both a technical and a visual perspective. As a result, machines and plants operating in temperature ranges between 30 °C ... +60 °C can be designed to more compact dimensions.

Accessories

OMH-SLCT-06

Swivel Bracket

OMH-SLCT-01

Quick clamp and adjustment system

V19-G-EMV-BK0,3M-PVC-V19-G

Double-ended cordset, M12 to M12, with EMC filter, 8-pin, PVC cable

OMH-SLCT-03

Mounting bracket including adjustment

OMH-SLCT-04

Mounting bracket including adjustment (with loose bearing)

OMH-SLCT-05

Mounting bracket including adjustment

AA SLCT-01

Profile alignment aid; simplified alignment of the SLCS and SLCT safety light curtains

V1-G-BK2M-PUR-U

Female cordset, M12, 4-pin, PUR cable

V1-G-BK5M-PUR-U

Female cordset, M12, 4-pin, PUR cable

V1-G-BK10M-PUR-U

Female cordset, M12, 4-pin, PUR cable

V1-G-BK15M-PUR-U

Female cordset, M12, 4-pin, PUR cable

V19-G-BK10M-PUR-IEC

Female cordset, M12, 8-pin, PUR-cable

V19-G-BK2M-PUR-IEC

Female cordset, M12, 8-pin, PUR-cable

V19-G-BK5M-PUR-IEC

Female cordset, M12, 8-pin, PUR-cable

V19-G-BK2M-PUR-U-V1-G

Connection cable, M12 to M12, 8/4-pin, PUR cable

IO-Link-Master02-USB

IO-Link master, supply via USB port or separate power supply, LED indicators, M12 plug for sensor connection

IO-Link-Master-USB DTM

Communication DTM for use of IO-Link-Master

PACTware 4.1

FDT Framework

IODD Interpreter DTM

Software for the integration of IODDs in a frame application (e. g. PACTware)

LGM IODD

IODD for communication with LGM-IO-Link sensors

LGM DTM

DTM for communication with LGM sensors

Other suitable accessories can be found at www.pepperl-fuchs.com

Mechanical specifications					
Housing width	20 mm				
Housing depth	30.5 mm				
Housing length L	see Table 1, max. 2260 mm IP67				
Degree of protection					
Connection	Emitter: 200 mm connecting cable with 4-pin, M12x1 connector Receiver: 200 mm connecting cable with 8-pin, M12 x 1 connector Cable cross section min. 0.25 mm ² Max. cable length 30 m				
Material					
Housing	extruded aluminum section, Silver anodized				
Optical face	Plastic pane , Polycarbonate				
Mass	see Table 1, max. 1200 g (per profile)				
Compliance with standards and directives					
Directive conformity					
EMC Directive 2004/108/EC	EN 60947-5-2:2007				
Standard conformity					
Product standard	EN 60947-5-2:2007 IEC 60947-5-2:2007				
Approvals and certificates					
Protection class	III (IEC 61140:2009)				
UL approval	cULus Listed				

Operating principle

CCC approval

The light grid comprises a transmitter unit and a receiver unit; the monitored surface is located between these units. The switching command and measurement of the object is triggered when an object enters or is already present in the monitoring field.

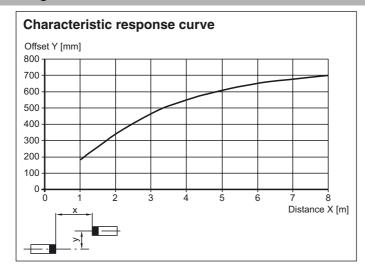

CCC approval / marking not required for products rated ≤36 V

The system's modular construction allows even the most diverse gaps between light beams to be implemented, enabling light grids in the LGM Series to be used to optimum effect and tailored to the specific application in question.

The system is programmed via the integrated touch field or via the IO-Link interface. Output of the analog measured value is included in the IO-Link protocol. Users can choose from a vast selection of integrated measurement protocols. The most important measurement protocols are:

- · Lowest position of the object
- · Highest position of the object
- Height of the object
- · Height of the object as the total height of all partial objects
- Height of the largest partial object
- · Mid-position of the largest partial object
- · Lowest position of the largest partial object
- Highest position of the largest partial object
- ...

Curves/Diagrams

Additional Information

Table 1:

Switch-on delay, maximum switching frequency, and maximum time delay before availability:

Field height [mm]	Switch-on delay Q [ms] Without object parameterization		Switch-on delay Q [ms] - With object parameterization - Updated measured value		Maximum switching frequency [Hz]	Maximum time delay before availability tv [s]
	typ.	max.	typ.	max.		
100	3	5	5	7	118	0.9
200	3	5	6	9	101	1.0
300	3	6	7	10	88	1.2
400	4	7	7	12	78	1.3
500	4	8	8	13	70	1.5
600	5	8	9	15	63	1.6
700	5	9	10	16	58	1.8
800	5	10	10	18	53	1.9

Design and Function

Safety information

The device must be operated only at low protective voltage where there is safe electrical isolation. Modifications and repairs must be carried out only by your supplier!

The system must be maintained and inspected on a regular basis.

A soft, clean cloth may be used to clean the system. Do not use any aggressive or abrasive cleaning agents that will corrode the surfaces. The device must not be subjected to severe impacts or vibrations.

Commissioning

Prerequisites

- The transmitter unit and receiver unit have been mounted and aligned correctly.
- The electrical connection has been established as per the information in the connection diagram.

- The signal output responds to object measurement.
- If at least one beam of light is interrupted, the output remains active for as long as the object is detected.

Troubleshooting

- Measure operating voltage
- · Check cabling.
- Check transmitter and receiver unit for dirt. Clean if necessary.

Function indicators

A green LED for indicating the operating status "Power ON" and a yellow status indication LED are fitted on the connection side of the profiles, behind the lens cover.

Transmitter Unit

Function	Description of Diagnosis
Green LED to display operating status permanently illuminated	Power On
Green LED to display operating status is not illuminated. Yellow LED to indicate status is flashing	Energy-saving mode
Yellow LED to indicate status is not illuminated	Transmission power of transmitter is low
Yellow LED to indicate status is permanently illuminated	Transmission power of transmitter is high
Yellow LED to indicate status is flashing rapidly (approx. 8 Hz)	Fault state
Yellow LED to indicate status — brief change in light emitted	Test input is activated

Receiver Unit

Function	Description of Diagnosis
Green LED to display operating status permanently illuminated	Power On
Green LED to display operating status is not illuminated	Energy-saving mode
Green LED to display operating status is flashing at brief intervals	IO-Link mode active. Possible to parameterize the device only via IO-Link
Green LED to display operating status is flashing (4 Hz)	Fault status: short circuit at the outputs
Yellow LED to indicate status is permanently illuminated	Detection field interrupted
Yellow LED to indicate status is not illuminated	Detection field is clear.
Yellow LED to indicate status is flashing (approx. 4 Hz)	Insufficient stability control
Yellow LED to indicate status is flashing rapidly (approx. 8 Hz)	Fault state: fault during signal measurement

Resolution and Beam Gap

The optical resolution of the light grid corresponds to the size of the object that can be detected.

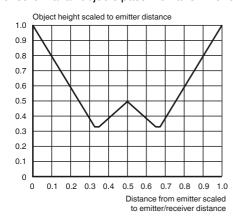

The values specified in the technical data under "Optical Resolution" apply if signal tracking for the threshold value is activated. Where the system is parameterized via the touch field menu (level 2, "Signal Tracking"), the value is automatically set to 60%. It is not possible to set other values. To parameterize the system via IO-Link, a threshold value of at least 60% must be entered. Signal tracking for the threshold value is deactivated by default, increasing the optical resolution by a maximum of 4 mm. By selecting 3-way crossover of the light beams, the resolution of the light grid is refined.

The switching outputs respond to any instance in which the beam is interrupted by an object. Selective object detection can also be parameterized using predefined or taught-in objects. Up to 2 beam areas can be suppressed (blanking).

The devices are supplied without object detection programmed, with signal tracking of the threshold value deactivated, and with a beam path with a 3-way crossover.

Resolution of the Crossed Beam Arrangement

If 3-way beam crossover is programmed, the resolution is refined. In the case of 3-way crossover, this means that the increased resolution is offered once 25% of the transmitter unit range or receiver unit range has been covered. It is therefore necessary to ensure that all objects pass the transmitter or receiver with such a gap.

Date of issue: 2018-08-23

Release date: 2018-08-23 10:30

IO-Link

The sensor parameters are device-specific and are described in the standardized IO Device Description file (IODD). The IODD can be read into different engineering tools using IODD support from different system providers. The sensor can then be configured or diagnosed using the relevant tool and a user interface generated from the IODD.

The IODD interpreter are available in the corresponding product description on our homepage, **www.pepperl-fuchs.com**. For the IODD description contact the P+F support.
