

Features

- Maintenance indication via LEDs
- Status indication input
- Status indication to control via solid state relay
- Mounting on base module, pluggable

Function

The maintenance status module indicates that the protective effect of one of the monitored protection modules is decreasing and that the protection module is at the end of its service life.

The status indication is transmitted to the control via the status indication output. The status indication output is performed via a solid state relay.

The device switches if a maintenance signal is detected on one of the monitored protection modules.

The device has LEDs for the power status indication and for the maintenance status indication.

The device is plugged onto the base module and, together with the base module, forms the evaluation unit.

The device can be replaced without tools by a locking lever.
